Our club here at work bought such a rig to use for an emergency communications setup (i.e., there's an earthquake, the phones are down, and we need to call for a fire truck; (we're out in the country))

Our primary consideration was ease of use, as we'll probably not use this radio very frequently, so we needed something we could figure out without a manual, at least for the basic stuff.

We wound up getting an ICOM IC-2340H. It also has the attraction of the ICOM service center in nearby Bellevue, WA.

The radios we looked at were:

Icom IC2340H, Yaesu FT-5200, Standard C5718, and Kenwood TM-733A.

We've only had the ICOM for a couple of weeks, but so far I really like it. It's relatively easy to use, the duplicated controls for VHF and UHF make it easy to tune and control. We are also across the street from a fairly high powered UHF pager transmitter, somewhat notorious for causing intermod problems. We haven't yet heard any intermod of significance on the ICOM from it.

A personal note on the Kenwood: playing with it in the store, I got
it locked up solid, just trying to tune to a memory channel. So locked
up that the salesman had to cycle power with reset depressed to unlock it!
I did not find it's user interface at all intuitive.

The standard was also fairly unfriendly I thought; *All* the controls are
on the microphone, and I just looked at it in confusion for a minute and
put the mike down.

I did a score sheet on the radios we looked at, and here it is:

Wt Icom Std Yaesu Kenwd
3 Ease of changing bands 4 2 3 3

3 Ease of recalling and setting memories 4 1 2 1

3 Ease of direct entry of frequency (VFO) 4 2 3 3

3 PL tone stored with memory channel 4 4 4 4

2 Automatic determination of repeater 4 ? 4 ?
splits with frequency

3 Ease of going simplex 3 2 3 2

1 Back-lit keys and functions 3 2 1 4

1 Head set and mike

2 Ease of power output change. 3 3 4 4

3 General ease of control use. 3 1 3 2

1 Dual in-band recieve (listen to 2 2m 0 4 0 4
channels or 2 440M channels at once.)

1 Auto-mute of un-selected band 0 4 0 0

2 Built in diplexer 4 4 4 0

Score: 87 64 75 65

Hope this is of some use..

I just went for the Standard 5718. I really like it; especially the way
that you can control the entire rig from the display mic. When parking on
the street, I just put the mic under the seat with the radio and no one
know's it's there (besides the antenna on the car). The expanded receive
is the widest on the market and the thing is packed with features.

[3]

Hi David. I have two Yaesus mobile dual banders, an older FT-4700 and a newer FT-5200, both in current service. I choose them both for the remote mount capability of the front panel. It is the only way to get both bands neatly installed in a modern auto with a center console. It allows for a real slick installation. Both rdios have been flawless. The 4700 is mores than 4 years old. The 5200 is about 18 mos old.

I have heard that the Alinco radios are very subject to intermod interference. I can tell you that the Yaesus that I own are not immune either when in high RF areas such as NYC. Some of the dual banders need an external duplexer if you plan to use a single dual band antenna. That costs about $50. The 4700 needs one, the 5200 has it built in. There are pros and cons to both scenarios. If you wish to run an amp on only one band, the external duplexer allows you to do that in only one bands feedline. If inetersted in that, be sure to get a duplexer and antenna of suitable power. There are some dual band amps, but mostly lower power than I usually use. I prefer the Diamond line of mobile antennas.

Good luck,

Tom
K2CZ

---

[4]

I have Kenwood TM742. I bought it because I already own a Kenwood TH78A. Also, a bunch of my friends also have Kenwood; that makes it easier to learn from each other.

In general, I like the radio. There is no particular point I dislike about it. I live in L.A. Intermod is generally not a serial problem for me, may be I am not in the most series area. When I do experience intermod it is generally in the 440 MHz band.

One nice feature about TM742 is that you can add a third band, such as 220 MHz, 50 MHz, or 1.2 GHz.

David,

I will tell you about which radio to purchase but please send me all you comments because I am also interested on what others have said.

Personally I would purchase the Yaseu FT 530. The Kenwood TH series has great audio and features however it is a bit finnicky and not very robust and Kenwood is very expensive to repair. The Icom W21A has lousy audio but a very capable rig. Good receive capabilities form about 100MHz to 900MHz.

The Alinco is also not a bad piece of gear however the current models do not seem to be put together as well as the others.

Regards,

Len Spain

David,

I'm using a Kenwood TM-731A. I've only had one problem with it that I hope is cured. If I needed another mobile rig I would consider another Kenwood. If you need a Duplexer I recommend a Larsen. If you purchase a duplexer, especially a Genisys, I would check it against it's performance specs.

If you're thinking of using DSQ encoding/decoding check to see if any repeater you might be using will pass the DTMF tones. The ones around Kansas City often do not. The repeaters I worked on decoded the DTMF,filtered it out, regenerated it cleanly to the phone lines, then kept it from being re-transmitted. Not only did this give more reliable switching, it keeps those monitoring from decoding DTMF phone numbers.

Good Hunting,

Thanks for all the suggestions on the SuperMorse situation. It looks as if the software is not calibrated for the 486, and hence the PC is reading it too quickly. I think the version I have is the lastest. I have

since found other software that does work.
Thanks,
Chris

>receiver sensitivity or desensing inside the case.
>
>3. Any experience with this? Remedies?

We found that the receiver was rather insensitive to start with. We
used a preamp from the previous repeater, and it's working again as well
as before we switched radios. I'd like to use a more modern preamp, though.
GE describes a preamp in their repair manual, but I think a GaSFET with
helical resonators would be an improvement. Anyone know of a good supplier?

Don't forget to adjust the squelch sensitivity control if your radio has one.

Well, just goes to show that the FCC just doesn't care about CB anymore.
And it would be my guess that unless they are interferring with some
comercial service that they will not lift a finger to help.

It is pretty sad when you are REQUIRED to do thier work, (finding the
address of the person, collecting evedence ect)

My humble advice, is get a ham licence,and use a HT for your local talking,
and use your cb for those road trips.

Steve.

P.S.

If your relly pissed off, the ol' needle in the coax trick still works.

I'd check the +/- rails to the deflection amp (or even before it gets there)
before I got too depressed about the CRT.

Symmetrical distortion sounds mighty suspicious for a CRT fault.

Good Luck.

4059. RFD: Rename of rec.radio.amateur.equipment to rec.radio.amateur.swap

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-17 00:00:00 UTC
From: mark@bohica.net
Message-ID: <D8q7sE.Eqx@bohica.net>
Source record: 217522
Cross-posted to: rec.radio.amateur.equipment,news.groups,rec.radio.swap

Well, my prior bid to have rec.radio.amateur.equipment amalgamated with rec.radio.swap failed because the users of rec.radio.swap wanted nothing to do with the small number of discussion articles in rec.radio.amateur.equipment and felt it would degrade their group.

However, since then, it has become more and more impossible to find equipment discussions in the rec.radio.amateur.equipment group because of all those users that fail to use the appropriate rec.radio.swap group for the `for sale' and `equipment wanted' ads. I was privy even to a system operator removing the rec.radio.amateur.equipment group from distribution because it was too much like the other *.forsale groups, and feel this is only hurting the group's originally intended purpose that the rra-wg participants had worked so hard for.

In addition, I thank:
Paul Schleck Michael Crestohl Martin Brenner
Jay Maynard Alberta Woodhull Charles Copeland
Nick England Anthony Gold Todd Little
Mr Schaeffer Mike Serafin Mr Tuka
Mark Conner Bob Levine Bob Witte
Fred Davis Henry van Cleef Bill Vaughn
Mr Cenobite Paul Bock Myself(?)
For their efforts in keeping this group for what we all originally intended it for and for defending it through active participation, private email to offending posters, and a general pride.

As flame bait, I feel that we should force all ix.netcom.com and aol.com users to be forced to read the FAQs for the rec.radio.amateur.* groups before being provided access ...

However, there comes a time to admit a mistake, so I see a couple avenues to address this issue:
1) To continue informing people that I run an unnofficial, manually operated, news to email server for rec.radio.swap for those that find out that for-sale groups don't propogate, are forbidden on *.mil machines (actually eliminating rec.radio.swap and soon rec.radio.amateur.equipment from distribution), and to announce that rec.radio.swap@ve6mgs.ampr.ab.ca is a mail to news posting mechanism for the group.
2) To build up a larger volunteer list of individuals that are willing to send private email to offending posters to everyone's frustration.
3) To announce my willingness to moderate the group (my credentials in moderating the rec.radio.info group being noted).

4) Propose an amalgamation of rec.radio.amateur.equipment with
rec.radio.swap (bid failed).
5) Propose a rename of rec.radio.amateur.equipment to
rec.radio.amateur.swap to address the vacuum left by the removal
of rec.ham-radio.swap from years gone by (bid expected to fail)
6) Ask users of rec.radio.amateur.equipment what they want to do
with the users that are posting their articles inappropriately
and neglecting to use the rec.radio.swap group for what it was
originally intended (to protect the rec.radio.amateur.* groups
from losing propogation privaledges).
7) Therre is no suggestion numebr 7
8) Laugh Hysterically

MWAHAHAHAHAHAHAHAHAHAHAA ;->

Ciao -- Mark Salyzyn

To place the KAM in CW mode, first (using Pacterm) get your cmd: prompt - that's the main command prompt. Then type CW and press return - you are now is CW mode. To exit CW mode, type a CTRL-C and then the letter X - no spaces, just <CTRL-C>X.

The problems with the trade imbalance are caused primarily by autos and auto parts, not electronics as one might think. Clinton is rightfully targeting the high end autos (hey, all the Democrats love to stick it to those nasty, gready rich, right (not my belief)). He is not as of yet going after electronics.

The devaluation of the dollar is taking care of evening out the prices between the rice boxes and American radios. Ten Tec radios are now competitively priced against the rice boxes.

As for the Rat Shack stuff, most of that junk is imported from Korea where they can get low prices (in return for low quality of course). I would not worry about that stuff going up in price.

In other words, we are safe for now.

Regards,

Duffy

Source record: 217531
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I live in an apartment with access to the attic. I want an antenna that will help reduce TVI. I've heard ground plane will help, so ...

A slinky is (2.75" dia.)X(PI)X(68rings) = 62 feet long. 1/2 a slinky equal a full wave 40m element. If I mount 1/2 a slinky on a seven foot dowel, and spread out three more 1/2 slinkys on floor for ground radials, will this make a good 40m low-TVI antenna ???

I realize at 90 degree angles it would be 30 ohm impedance, but a antenna tuner should fix that, right?

Is this feasible or does it even make sense ???

Source record: 217533

The 1A2 is a dual trace, 50mv/cm, DC to 15 Mhz, multiple trace unit.
There were 4 'L' units, :
1L5 ... 10hz to 1 Mhz Spectrum analyser
1L10 ... 1 Mhz to 36 Mhz S/A
1L20... 10 Mhz to 4.2 Ghz S/A
1L30 ... 925 Mhz to 10.5 Ghz
I can use the '1' series on my 535 Tek scope, so I would think they
could be used on most 500 series scopes.
There were differential units available for the 500 series, but I
cannot find any reference to the ones you mention in thed 500 series
list. They may be for othr series of scopes. Hope this helps.

Hi

MIT flea: 3rd Sunday every month (April though October).

Last weekend in NH I acquired a large number of surface
mounted resistors (5% and 1%), a few rolls of ordinary MF resistors,
resistors in bulk packaging,
some silver mics caps, ceramic caps w/ tempco's (Nxxx and Pyyy)
dual pole Reed Relays, 25MHz crystalls, some 0.02% resistors,
a few hundred pulse tranformers (PE 5764 and some dual ones: PE 65793)
, 3.5V/750mAh lithium batteries,
about 1600 radial 220uF/8V tantalums, 2500 axial 5uF/35V tantalums,
a roll of surface mounted "PCA" EPA1140-40 whatever those are,
177 surface mounted SN74F08DR. Ohh, a tray of 72 pin SIMM sockets.

I have more than I need in a lifetime and I'm looking for other
people with surplus stuff.

I'm looking for surface mounted resistors (1206) filling out the gaps in my
collection: I have 10M, 1M, 750k, 681k, 510k, 274k, 240k, 220k,
191k, 120k, 100k, (and 100k 0804), 95k3, 91k, 90k9, 84k5 (1212 shape??),
71k5, 69k8, 61k9, 51k, 47k, 39k2, 33k 27k, 15k, 13k, 12k1, 12k, 7k32,
5k11, 4k99, 4k64, 4k34, 4k22, 3k4, 3k3, 3k, 2k21, 2k, 1k5, 1k2 ....
haven't had time to catalog the 100's and 10's yet.
Especially I need 400ks, 300ks, and a better cover between 51k and 7k.

I need ceramic "feedthrough" caps (just a few), some trimmer caps
suitable for 100 MHz region, ceramic bypass caps including surface
mounted types, tantalums, aluminum electrolytics, 7805, IRFZ44,
6AU6 on an on an on ...

I have a vintage KLM (not Mirage) 2 meter amp. It is supposed to produce
160 watts from 10 in. It only puts 80 out. I suspect that the driver got
fried when a previous owner put 30 watts in.

I like schematics before I tear into equipment. Does anyone have one?

Thanks

4074. Re: Yaesu FT-530: 800/900MHz reception? READ THIS (SERIAL NUMBERS!!)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-17 00:00:00 UTC
From: gdavis@ti.com
Message-ID: <3pd5o3$gld@tilde.csc.ti.com>
Source record: 217537

Here is the answer to your FT-530 800 Mhz receive question:

I called Yaesu (in Tokyo) and had a lengthy conversation about 800 MHz receive. (The California office in Cerritos does not want to discuss this....). Here are the facts:

Any FT-530 with a lot number 32 or lower is capable of receiving 800 MHz (800-950 MHz), after the mod widely published.

Any FT-530 with a lot number 33 or higher is NOT capable of receiving 800 MHz, although the PLL will still lock on 800 MHz freqs. It cannot receive 800 MHz because the entire 800 MHz front-end section is removed from the PCB. It is almost impossible to put back (although the PCB is the same).

How do you tell what lot you have?
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Look at the number after the letter in the serial number. If it is 32XX... or lower, you have 800. If it is 33XX... or higher, you are out of luck.

I am out of luck myself (my serial number is 4J39XXX.... I called about 20+ amateur stores in US and cannot find a NEW FT-530 with lot 32 or lower. I have settled on buying a USED radio.

NOW I A STUCK WITH MY BRAND-NEW NON-800 RADIO, AND IF YOU DO NOT WANT 800 MHZ (I WANT PUBLIC SERVICE FROM 800-865 BECAUSE OF OUR SECURITY REPEATER HERE AT TI IS IN THE RANGE), I HAVE A RADIO FOR SALE:

****
BRAND NEW (5 DAYS OLD) FT-530. BOUGHT FROM TEXAS TOWER FOR 380+TAX, WILL SELL AND SHIP FOR $330.
****

DOES ANYONE KNOW OF WHERE I CAN FIND ADDITONAL NEW FT-530S WITH LOT CODE 32 OR LOWER FOR FRIENDS HERE AT TI??

Regards,
Greg

> see prices listed.

I don't have any experience with W&W or Periphex, but I have bought a couple of batteries for my FT-530 from E.H.Yost (608)831-3443 and have been very pleased. The last pack that I bought was a FNB26S (7.2V @ 1500mAH) for $49. I also bought just the battery insert for the FNB25 for $16.00 (but its quite a job to cut open the old battery pack and put in the new batteries - Yaesu glues the batteries into the pack making it hard to get open).

I spoke with an owner of one of these rigs in Dayton. He gave it a double
thumbs up. Actually, I was talking with him on it. He bought it because
of it's intermod rejecting reputation and was VERY happy with the radio.

Source record: 217397
Cross-posted to: rec.radio.amateur.equipment,news.groups

I believe these forsale postings to rec.radio.amateur.equipment are caused by three things.

1) Those trying to sell amateur related equipment don't see a forsale group in the rec.radio.amateur newsgroup tree. For old timers, this is caused by laziness or rudeness. For newcomers though, it is a simple and obvious mistake, one not easily corrected through communications or postings.

2) The name rec.radio.amateur.equipment doesn't really reflect the purpose of the newsgroup if what is really wanted is technical discussion of a general nature, i.e. something not covered by the .digital, .antenna, etc., groups.

3) Some newcomers are going to post to whatever newsgroups seem remotely related no matter what is done. This is unavoidable. A newcomer sees getting maximum visability for their ad by posting in many groups. They haven't yet realized that it is inappropriate, i.e., they haven't learned net etiquette yet.

The postings by the old timers are probably not curable by any means other than a moderated newsgroup. I'm not particularly in favor of moderation and would rather see something else tried first. For the newbies, perhaps a simple name change would help cut down on first time offenders. How about a combination of renaming rec.radio.swap to rec.radio.amateur.swap and renaming rec.radio.amateur.equipment to rec.radio.amateur.techtalk or something similar?

No matter what is done, inappropriate postings should always get a response. It doesn't need to be a flame unless it was obviously done intentionally, i.e. repeat offenders, spams, etc.

You can buy just the cable from Yaesu for about $5. It's the plug with
a molded strain relief and about 6' of small zip cord. The only other
place I've seen that plug size used was for my Sony Discman.

Hi,

As an active ham and member of Amateur Radio emergency Services, I work a lot of public service events, severe weather watches and emergency events. To make using an HT during these events, which can last all day, a little easier, I'd like to have a custom earphone made. This would be the type that is used by television reporters that are molded to the wearer's ear and have a coiled cord running down to the HT.

If you know of any companies that do this sort of custom molding, please post a reply here or send mail. I'd appreciate any referalls that can be offered.

From a previous post....

Article: 41506 of rec.radio.amateur.misc
From: genew@techbook.techbook.com (Gene Wolford)
Newsgroups: rec.radio.amateur.misc
Subject: FT-530 mods. Here they are.
Date: 10 Jun 1993 18:14:56 -0700

This is a compilation of modification information I received in response to
my posted query and the info faxed to me by Yaesu.

There are at least 2 board layouts out there.
Note that while the jumper pad numbers have not changed, the board positions
of the pads have.

YAESU FT-530

Expanded Receive 110-180, 300-500 MHz
Expanded Transmit 130-180, 400-470 MHz

NOT LEGAL IN U.S.A - FOR EXPORT ONLY (The expanded transmit part)

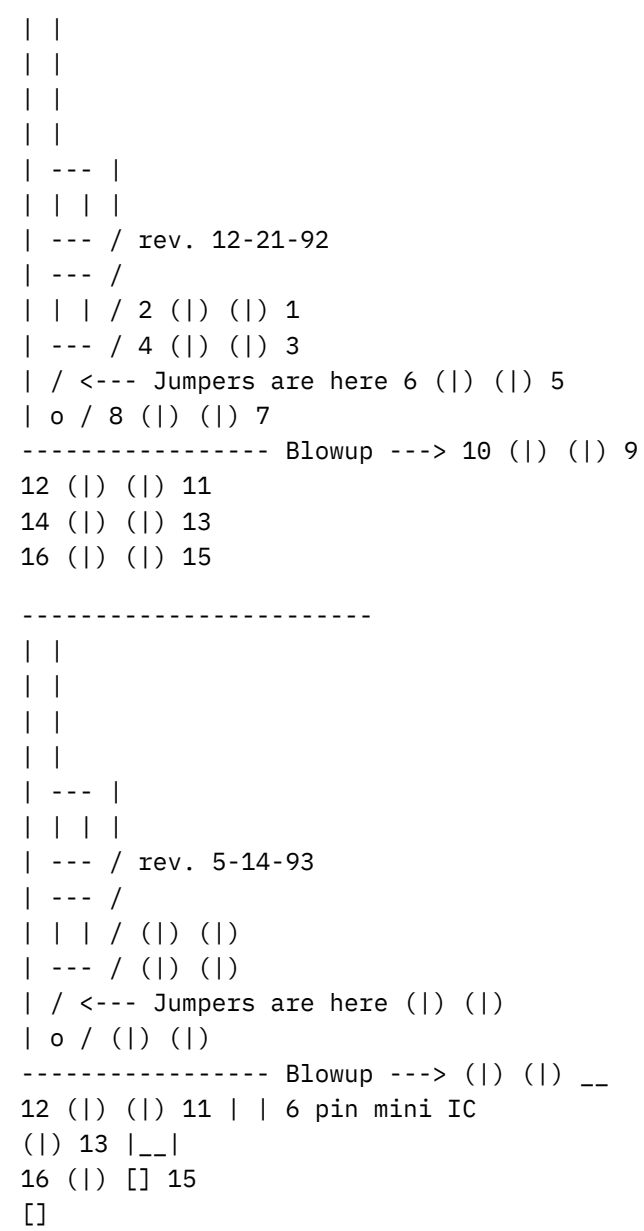
o Keep that magnifying glass handy! 8-)
o Be aware that your repeater memories, ect. will be erased. :-(
o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on
table.
o Note positioning of white paper insulator in right half of radio and
lift out
(don't throw away)

o Carefully locate Jumper Pad 13 and remove solder.

---
o NOTE: If you wish to restrict transmit to the ham band,
Carefully locate Jumper Pad 15 and remove solder.
Otherwise, leave pad 15 in place.
---

o Re-install white paper insulator, make sure ground tab slides through the
paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium
battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track

to radio body.
o Attach Antenna and Battery.
o Turn off Radio.... Press and hold both arrow keys while turning on the
Radio.
o Modification Complete.



Pad 15 now a vertical pad with a tiny
"zero ohm" resistor.

My rig got confused after this mod and it was neccessary to reset the
CPU. (The 70cm repeater offset register got fouled up and though it could
be incremented and decremented by the normal 50khz,
it went 0.01mhz, 0.06, 0.11, ect. instead of 0.00mhz, 0.05, 0.10, ect.).

Reset command: turn radio on while holding "MR" and "FM"
(Damn, memories erased again!)

If anyone figures out how to receive higher freqs, say up to 800-950mhz,
(so I can listen to the 900mhz ham band of course), 8-)
please let me know!

-mike

I know that the Icom W21AT and the Yaesu FT-530 can be successfully modified for extended receive. The FT-530's mod will also allow it extended transmit.

These mods and many more can be had at:

ftp://oak.oakland.edu directory is /pub/hamradio

For those who may have some literature, books, or excess gear and are willing to donate it in a worthy cause ...

The breakup of the Soviet Union has given the Republic of Estonia a new level of freedom but not much infrastructure to exercise it.

There is, however, an active group of hams in Estonia who are building an organization to train and license new hams. This program is deemed a national priority to provide emergency communications services. (Estonia's Red Cross has even less equipment). When they have a working program, it is expected that the other Baltic nations, Lithuania and Latvia will adopt it.

The biggest need is for training materials, (old ARRL license manuals etc), and gear. Old gear is fine, as it gives them a chance to repair it and learn electronics. (No junk as you don't want them to be too disappointed).

If interested, please contact:

Heino Jogis
839 Richardson Court
Palo Alto, CA 94304

4098. External Speaker: Buy Yaesu SP-7 or go Radio Shack?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-18 00:00:00 UTC
From: kucharsk@nessie.dr.att.com
Message-ID: <D8sKC3.H52@bigtop.dr.att.com>
Source record: 217411

I just installed a Yaesu 5100 in my console. It works great, but the audio from the internal speaker is a bit hard to hear with highway road noise in the background. I was wondering what people thought of the Yaesu SP-7 external speaker. It's small (roughly 3 x 2.5 x 2.3 inches) but pricy ($39). It does have a nice mobile mounting bracket, though. The alternative is something from the Shack.

How about it - is the Yaesu external speaker overpriced, or is it a nice unit for the money?

>.............
> Is this feasible or does it even make sense ???

Charles-

About the only thing that makes "sense" about it, is that you can try it, and it will probably work to some extent. That extent may be only a VERY short distance. But, do you have any alternatives?

I don't like the slinky idea, because of losses due to resistance. One slightly better alternative exists, if you can find space for a 15 foot dipole. You could take two mobile antennas like the Hustler or Hamstick, and mount them as a dipole. The company that makes the Hamstick, also sells a bracket made for mounting two as a dipole, with a U-bolt for attachment to a mast. The U-bolt holes could be used to nail the bracket to a wooden rafter, or for suspending the assembly with heavy string.

Taking a similar approach to your slinky, you might use 4 Hamsticks, mounted as a vertical radiator and 3 radials. However, I don't think this will work much better than using a single Hamstick radial. In other words, you could mount the dipole in a 90 degree configuration with one element vertical and one horizontal. As you mentioned, an antenna tuner should handle minor variations from 50 ohms at the feedpoint.

Take care that the end of your radials are insulated from their surroundings. Even though they are simulating a ground, they will have similar (total) voltages and currents as the vertical element.

kbarton@cwis.unomaha.edu

Thank you!

****

Subject: Manual for HW-16 and HG-10B
Newsgroups: rec.radio.amateur.equipment
Organization: University of Nebraska at Omaha (Faculty/Staff CWIS)

I need to find a manual for a Heathkit HW-16 tranceiver and the asso-
ciated HG-10b VFO. I would like to do an alignment on the receiver and am
considering modifying the transmitter at some time in the more distant future.
I received many helpful replies on the operation of the VFO some time
ago, and I know someone out there knows where I might obtain a manual, or at
least a schematic. I've been away from radio since...well, way back when,
and I'd like to start back with this radio which came to me without any docs.
Thanks for any direction.

You have to understand the difference between the Usenet Big 8 and
other hierarchies, specifically alt.

Here we have votes to determine before group creation if there's
enough interest, and an individual (tale) to send newgroup messages
that will be honored automatically.

In alt, there are no votes, anyone can send a newgroup message, and
any site can choose to honor it or not.

Nobody's BOUND by Tale, here, but I guarantee you a new rec group
will get at least 50% propagation, especially if it's part of an
existing subgroup such as rec.radio.amateur. A new alt group will
be extremely lucky to get 35-40% propagation.

And the more silly alt groups that get created, the more this
divergence occurs.

The flip side is that the big commercial sites (e.g. AOL, Prodigy,
Netcom <g>) newgroup practically everything that comes down the pike,
so that a large percentage of Usenet readers do have access despite
low propagation.

: other types of radios? Does any one know how the 5 brands rank in
: terms of amateur radio sales?
: Len

I suspect that the amateur radio market is but a small piece of
Standard's total radio manufacturing effort. They certainly do have
quality, innovative stuff for hams. But they're not in the mainstream of
amateur sales as are the "big 4." Guess it's just a marketing issue.

Too much gain in the mic audio can cause the transmitter to
over-deviate. I did not suggest that the person adjust the deviation,
only that he may have really been referring to deviation in a FM
transmitter.

4109. HELP, army surplus 6m handie align?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-18 00:00:00 UTC
From: rpmackin@ashley.business.uwo.ca
Message-ID: <3pfi2e$ns6@falcon.ccs.uwo.ca>
Source record: 217472

I bought a pair of 6 metre radios at Dayton.
They are Army surplus units, the rx clips on a helmet, and the tx is handheld
with 2 channels.

Receiving set, radio, AN/PRR-9
Transmitting set, radio, AN/PRT-4 (or 4A)

I know what formula to use in re-crystalling the units, but I need alignment
info.
The book makes reference to a service instruction guide;

TM 11-6625-937-12, for the alignment procedure.

I also would like to know if there is a easy way to allow a
carrier squelch to operate in the rx unit,
it currently has either PL(150Hz) or open speaker modes.

Any help would be greatly appreciated.

Thanks!

From: Greg Smith <greg.n.smith@daytonoh.attgis.com>
Message-ID: <D8ryrn.A6x@ranger.daytonoh.attgis.com>
Source record: 217473

Anyone own a Yaesu FT-2500M?

I'd love to hear comments. I've heard a lot of people praise
Yaesu but lately many have been trashing the name based on the
5100 and 5200 intermod problems.

The 2500 is strictly 2m but I wondered if anyone has one and what they
think of it. It looks like a really nice rig but I need to know if
it's reliable and if it has good audio quality.

Since reliability and quality seems to vary greatly between models in
any given line, I'm really only interested in comments on this one radio
(i.e. not a predecessor or sibling product)

Thank you very much.

4111. Re: RFD: Rename of rec.radio.amateur.equipment to rec.radio.amateur.swap

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-18 00:00:00 UTC
From: bob@mtdcr.att.com
Message-ID: <D8s22L.6ou@nntpa.cb.att.com>
Source record: 217474
Cross-posted to: rec.radio.amateur.equipment,news.groups

I really haven't noticed all that many "for sale" posts to the rec.radio.amateur.equipment group. When it does happen, we probably should send e-mail to the poster tactfully explaining (that leaves me out!) that rec.radio.swap is the appropriate place to post for sale messages and that rec.radio.amateur.equipment is for discussions of manufactured equipment, modifications, etc.

The /usr/lib/news/newsgroups file on our system says:

rec.radio.amateur.equipment All about production amateur radio hardware.
rec.radio.swap Offers to trade and swap radio equipment.

Anyway, I don't think we really need to rename the groups or to merge the two groups. We just need to educate people.

I note that the rec.radio.info FAQ is also cross-posted to rec.radio.amateur.misc. I wonder if it shouldn't be cross-posted to rec.radio.amateur.equipment as well. Or, at least, the section in part 2 that describes what the various newsgroups are for.

: >I just got my HF tech+ lisense and having trouble transmitting in my
: >apartment.
: <snip>
: >I find I can not transmit more than 5 watts CW without interferring
: >with my TV (using cable antenna). TV is eight feet from dipole overhead.

: Several things:

: 1. The dipole is probably overloading the TV. Eight feet is simply too
: close to avoid significant RF pickup. Try a high-pass filter at the TV input
: and move the dipole further away.

: 2. If your dipole isn't resonant, and if you have RF on the chassis of the rig,
: you may also be putting RF into the house wiring through your third-wire
: ground. You're right about the ground - it's difficult to achieve an effective
: RF ground on a second story. There are several solutions to this, but my
: favorite is to build a system that prevents the feedline (and chassis) from
: wanting to radiate in the first place. Having done this, any significant RF
: pickup by the house wiring can then be attributed primarily to mutual coupling.

: 3. Low-level harmonics from your rig may be interfering with the TV, simply
: because of the proximity of your dipole. A low pass filter at the transmitter
: might help, but bear in mind that if you have RF on the chassis, unfiltered
: RF will still be radiated.

: I've had many indoor antennas in the past. In some cases, the neighbors
: couldn't see my KW; in others, 10 or 20 watts had 'em banging on my door.
: The above will give you a start, but the ultimate complexity and cost of
: curative measures may depend on factors out of your control.

: 73,

: Jack WB3U

Good stuff, Jack!

I ran 200watts from a condo for several years, indoor dipole in the
attic space for 40 meter wavelength. Had the same type of problems
and one by one, got them all ironed out.

The funniest thing was when the neighbor next door was about to take
his wife to a psychiatrist because she was complaining of hearing
voices at night. Actually, I only operated at night so as to keep
any interference to a minimum. Unfortunately, their phone was

picking up my SSB xmissions and was in close proximity to her pillow. She would be hearing a muffled "garble garble quack quack" and had no idea where the sound was coming from and so came to the conclusion that she must be batshit crazy. Ooops. I was lucky enough to catch them before they actually went to a doctor. Had to put in suppression components into the phone, and we all had a good laugh.

Don't forget any smoke alarms too. After keying or while keying, see if you can hear any of your neighbors smoke alarms going! heh heh heh.

see ya.

I am considering a Yaesu FL7000, a solid state, auto tune 500w hf amp
for use with a Kenwood 850. I am looking for info on how well
the Yaesu amp works with Kenwood Rigs. Is there a way for getting
the auto-band-switch to work?

Any opinions about the Yaesu amp are welcome.

Source record: 217479

Can anyone share with me their experience with the Kenwood 241A 2-meter rig?

(I've gotten some great feedback so far... but I'd like some more...)

Is there a mod to open up the transmitter? Is it an easy one... like the Yaesu 2500?

Thanks, in advance...

Geoff

I've used my TS-241E (European) for 2 years and am still very pleased with it. However, Kenwood no longer sell the 241 in the UK, as it has been superceeded by the TS-251

I *did* have a slight display problem with the 241, admitedly as a result of dropping it 4 feet onto a solid surface, but have since fixed that by resoldering the connector between the display PCB and the main board.

From: thendy@huachuca-sec1.army.mil
Message-ID: <2FBA3854@huachuca-sec3.army.mil>
Source record: 217481

I recently went through the same decision process. I chose the Yaesu FT-11R. The Yaesu got the nod because for my requirements (back country camping where I might need all the power I could get) the Yaesu fit the bill. The 5W version of the FT-11R can be purchased for about $20 over the price of the standard model. The Kenwood, however, required you to purchase the base model and then the separate high power battery, about $90 more. If you don't need the extra power or you want two battery packs then this may not be an issue for you.

I have had my Yaesu about 2 months now. The only problem I encountered is that the low battery indicator only gave me about 5 seconds warning. After that the entire display began blinking off and on and it was impossible to turn the unit off. I had to remove the battery pack to shut it down. After recharging I found that all the settings had returned to factory defaults, including all my memories. I called the tech support folks at Yaesu. First they told me that they know their low battery indicator is poor. However, the blinking and loss of the memory is not normal. They said that they knew some of their units had chips with errors on them. Their is no diagnostic to tell which ones. They said if it happens again to send it in and they will replace the chip. I'm not anxious to let it run down again and try but I will.

Aside from the above problem all else works as advertised.

Good Luck,

Ted Hendy

All the electronics stores are giving me blank stares.
If you have a clue as to where I can locate and buy
on the used market the following items please let me know:

1.) A Traveling Wave Tube amplifier with power
supply and in excess of 10 watts.
in the 7-10 Ghz range (X band)

2.) A Spectrum Analyzer for microwave frequencies

3.) A 3 - port circulator (microwave)

Sincere Thanks

: I'd love to hear comments. I've heard a lot of people praise
: Yaesu but lately many have been trashing the name based on the
: 5100 and 5200 intermod problems.

I just got mine in and will be installing it in the car this weekend. I selected it for two primary purposes: I want a mobile I can switch from vehicle to vehicle, and when I have it in the truck, it has to be able to stand up to the rigors of back country driving (Bad roads, lots of bouncing around, I'm not talking of the sport of 4 wheeling, but exploring, going deep in the back country in the mountains and desert). The mil spec was a heavy draw. Now for first impressions:

It feels like it is very solidly built. I like the idea of the controls for working the memory being behind a little door so they don't get bumped accidentally. How well that door stays shut remains to be seen, but a rubber band should hold it shut if it turns out to fly open. The controls feel nice. Can't comment on the display or operation yet. I'm not sure about the mic connection, but will have to wait on that also (it's like a 8 pin RJ59 telephone connector). It was a little bigger than I expected, but not too bad. The mic that comes with it feels pretty lightweight but fits the hand comfortably (sitting at home).

The manual includes some mods that can be made to improve certain aspects of operation, and explains what the cost will be. It's pretty well written, only two places I recall where it shows that English may not be the native language of the person writing that section. Seems to be pretty thorough. I'm sort of wishing I had bought the CTCSS decoder unit as well, but it's no big deal yet. Maybe later on when I need to use the truck as an automatic relay (in-canyon to truck have LOS, but not from in-canyon to repeater, etc.)

All in all, first impression isn't too bad.

4123. Reducing speaker output to earphone output

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-18 00:00:00 UTC
From: rap@hooked.net
Message-ID: <3pe7uq$7r3@its.hooked.net>
Source record: 217486

My HTX-202 does not have a true earphone-level output. It DOES have a speaker output (and is labelled thusly) with a power output of anywhere from 300 mW to 1W into 8 ohms, depending on power supply voltage. Even when the volume is turned all the way down, there is a tremendous amount of audible hiss in an earphone. And when the sqelch opens and closes, it makes my head ring.

Part of the problem, I'm sure, is that I'm using Walkman-style headphones which are rated at 16 ohms, generally. I'd like to reduce the speaker output to something like 12mW or so, but I know next to nothing about circuit design. What components can I install between the speaker jack and my earphone/headphone that will save my poor ears? Any advice is appreciated!

Joseph Moschella (n9yjz@earth.execpc.com) wrote:
: I'm not sure if this is true about the other rigs, but I'm almost
: sure I've seen additional faceplates for the TM-733A for sale around 200
: dollars...correct me if I'm wrong...but I don't think its the same way
: for all of their rigs. Sorry about your troubles.

: Joe, N9YJZ

I once bought a Yaesu 4700 removable faceplate radio (without the face plate) in hopes of repairing it. I was surprised when they would not sell me a faceplate. I tried for weeks to talk them into it, but no dice.

I finally got a service manual, an noticed that they listed part numbers for all of the pieces (pc board, case connectors, knobs etc.). I called them up, and told the guy (they same one I had been going 'round in circles with...), that I wanted to order some parts. Half way through the list of parts, he said "Hey, that sounds like you want an entire faceplate!" I said "Bingo! give the man a cigar". Within a week, I had a factory assembled faceplate, and at a reasonable price too.

It just goes to show that there is more than one way to skin a cat...

Hi,

I have just bought a Kenwood TH28A 2m HT and was told it could receive
the aircraft band ~118 - 128MHz AM.
How do you get it to do that?
My frequency limits seem to be 136-173MHz FM.

I am interested in any mods available for this radio also.

Please feel free to email direct.

I just my $.02; I just bought a Yaesu FT-5100 last Saturday and now wonder how I ever did without it. IMHO, it's an absolutely wonderful radio.

For that matter, I also own a Yaesu FT-411E HT.

If the FT-2500M is anything like these two units, I'd wholeheartedly say to go for it.

From: willd101@aol.com
Message-ID: <3pjoed$2aq@newsbf02.news.aol.com>
Source record: 217348

I bought my dad a used Alinco DJ120 for Christmas and it is now only putting out about 0.05 Watts. It worked fine (putting out about 2 watts from 7.2V) when I got it. He can still hit a couple of repeaters with this
real low power, but I would like to get it fixed.

Can anybody point me to where to get a schematic for it or a repair manual? Or, if all else fails, a phone number for Alinco's repair service.

Thanks,
William

4136. Can Kenwood TH78a handle VOX mic/ear unit?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-19 00:00:00 UTC
From: msattler@jungle.com
Message-ID: <msattler-1905952016370001@slip125.sirius.com>
Source record: 217349

The Kenwood TH78a manual makes note of an accessory external mic/ear unit that has a PTT/VOX switch in-line. The manual does not, however, give a clue if the TH78a can be switched into VOX mode. The folks at Ham Radio Outlet/Oakland CA didn't have a clue, were busy, and one was very ill. (Larry, I hope you're feeling better.)

Still, the question stands. Can the TH78a be switched into VOX mode, and if so, how?

I've been thinking about finding a rig that will do SSB & CW on
6 meters. I know there are all of these fancy all-mode radios
available new, but I really don't need FM (I already have an
FM radio on 6).

So, I was wondering: What are the good "classic" SSB/CW rigs
for 6 meters? What might the going rates for such things, if
you happen to know?

I'm half tempted to ask about AM, but I wonder how much AM
activity there would be these days...? I have seen AM rigs
at the swaps for cheap prices... (a Johnson rig and a Gonset
Communicator...;-) but nothing in the CW/SSB department.

thanks for taking the time to reply!

Greetings,

I am posting for a fellow amateur operator who is looking for soft mods (ie, available through keypad presses, etc) for the Kenwood 79A. I have reviewed the files at oakland.edu, but have only found the ones that require physical modification to the unit. If anyone knows of such soft mods (if they exist), could you email them? I will summarize and post if I get multiple replies and there is interest. Thanks.

Yes, issue the command BR 0. This will turn the light off and the humm will go away! Not to good, is it? This is more likely to occur with certain power supplies such as the Astron, particularly if that power supply is supplying power to other equip. particularly the radio. Even a basic Radio Shack supply dedicated to the PK900 will be much better. I hope this helps

Hello.

I have a copy of a registered version of LogWindows V2.0 that was given to me a while back by a friend. I am thinking about purchasing this program in a while, and I would like to play with the copy that I have. However, I don't have the manual and neither does the guy I got it from. Anyone using this, I would like to ask if you could help me with two things. I am using this with a PK232 and a 486 dx 33. I would like to know, why when I try to use the tnc, it says that I don't have Pakratt for windows running. I know I don't...is that a separate feature I am supposed to buy? I cannot find anywhere on there where I could change from the different modes. I have tried all the keys and cannot figure this out. Also, what are some of the basic commands for this program such as those for transmit, receive, etc...

Please let me know if possible...just email to

djansen@umr.edu

Thanks,

Dwain

Hi to all.

I have a Ericssaon GE M-PA. This one is in the military low UHF band, the freqs. programmed in are in the 406 to 413 range. The model # is PAPATH and appears to have been made for the Army.

Here's the question is this radio "keyboard programable" or does it require special programing hardware/software.

This perticular radio only has the upper 4 buttons available, labeled 'step', 'scan', 'spc' and '2nd', the remaining 12 positions, 1-0 and * _ are on the circuit card but are hidden behind the front panel.

Any chance this radio can go up into the ham UHF band 440-450.

Any information would be helpful and thanks in advance.

>

I've had my 2500 for 6 months now.

Likes: absolutely NO intermod, rugged construction, backlit mic for night DTMF diddling, large display, auto power off in case you forget to turn it off in the car, alpha numeric naming of freq's, excellent manual.

Dislikes: no autodial memory storage, modular mic plug (harder to wire for packet unless you buy Yaesu's own packet cable), no extended RX below 140 Mhz.

I would buy another without hesitation. If you need more specific info, let me know. 73/Terry VE4UC

nods for the IC720A one of these was written bu WB0GAZ
David G.Feldman.

I tried to contact him at the addr. that the file/mail is showing
but i got the mail back telling me that that user at that
system is not present , this can be possible because the mail is
of 1992.
Now the question is:
Is David still in the net ?
I want to ask him more details about what he did.

I include here that letter so that if somebody got more
from him can supply the material also to me.

Anyway I hope to catch him here !

any suggestion is welcome

thank all

Roberto

------------included text----------------------------
Newsgroups: rec.radio.amateur.equipment
From: dfeldman@teal.csn.org (Dave Feldman)
Subject: Modifying IC-720A to get rid of rotary relay
Message-ID: <CDzEKC.9B@csn.org>
Sender: news@csn.org (news)
Nntp-Posting-Host: teal.csn.org
Organization: Colorado SuperNet, Inc.
Distribution: usa
Date: Sun, 26 Sep 1993 22:02:34 GMT
Lines: 35

I have just finished modifying an old IC-720A HF transceiver to replace
the rotary relay filter control with a set of reed relays and a small
digital circuit to select the appropriate relay and provide feedback
to the existing CPU in the radio so it thinks it's still on the rotary
relay. The cost for parts was about $25; the cost of my time was slightly
more than that, but it was "fun".

The modification is so far successful, and the radio is much quieter in
band switching as well as being more reliable (the old rotary relay was
impossible to get mechanically aligned correctly, leading to poor
connectivity
between the rx/tx and the antenna, as well as many missed stepping

pulses).

Summary: Use the step-pulse line to drive a small SPDT relay; use the SPDT
relay to drive an R/S flip-flop (built from two nand gates) to provide a
clean step signal (the existing step signal has some kind of very high speed
clock train superimposed on it and therefore was not usable directly). Feed
the pulse train into a CMOS decade counter type 4017. Take the appropriate
decade outputs (active high) and recreate the switch-position feedback signals
using a small diode matrix ala the original design. Also use the decade outputs
through 33K resistors to turn on 2N3904 NPN transistors, which are used to
select the appropriate (1 of 7) DPST reed relays. The CMOS chips (the nand
gates and the decade counter) can be had at Radio Shack and must be powered
from 9V (or so) because the radio does not use 5V logic (of course...)

I mounted the reed relays inside the original low-pass filter subassembly,
and the rest of the circuitry on a small perf-board near the SWR module
(connected by ribbon cable).

This is not a detailed design description but if you are interested I will
provide more details. This project did ssalvage an otherwise-worthless IC-720A,
but I don't think I'd do it again (rather time consuming, but perhaps you
can benefit from my experience and save some time).

Inquiries to dgf@netcom.com 73 Dave WB0GAZ

The breakup of the Soviet Union has given the Republic of Estonia a new level of freedom but not much infrastructure to exercise it.

There is, however, an active group of hams in Estonia who are building an organization to train and license new hams. This program is deemed a national priority to provide emergency communications services. (Estonia's Red Cross has even less equipment). When they have a working program, it is expected that the other Baltic nations, Lithuania and Latvia will adopt it.

The biggest need is for training materials, (old ARRL license manuals etc), and gear. Old gear is fine, as it gives them a chance to repair it and learn electronics. (No junk as you don't want them to be too disappointed).

If interested, please contact:

Heino Jogis
839 Richardson Court
Palo Alto, CA 94304
01 (415) 494-6468

Heino has set up a U.S. 501(c)3 tax exempt foundation, so your donations are tax deductible.

Heino set up the foundation to commemorate his son Karl, a ham, who died recently.

Message-ID: <D8tzEq.LuK@hpcvsnz.cv.hp.com>
Source record: 217434

Hi - If you are looking for an inexpensive way to get on 6 meters look for an old HF radio and modify it to run on 6. I once had a Heathkit SB-102 and modified it for 6. It worked MUCH better after I modified it than it previously performed on 14MHz.

Usually all it takes is ONE CRYSTAL and some retuned circuits in the non-IF circuits and you are done. One evenings work and you are there..

Don't bother with the AM stuff. You will find that almost everything is on SSB and under weak conditions, some CW.. Great band...

Well, I don't do a form letter, but my bwain does ...

---
rec.radio.amateur.equipment forbids* for-profit articles, defined as any article with a for-sale or want ad. The appropriate group for such a posting is in rec.radio.swap. rec.radio.swap offers a far superior audience for the sale and trade of radio equipment than the rec.radio.amateur.equipment newsgroup.

If you do not have access to the rec.radio.swap newsgroup, you may post the article via:
rec-radio-swap@utexas.edu
rec.radio.swap@ve6mgs.ampr.ab.ca
Or I would be pleased to manually post the message for you if you have some difficulties.

Note: * forbid is not too strong of a word. The *.mil sites actually will pistol whip you for such postings, and have threatened in the past to remove groups with a large numbers of for-profit postings from their servers, cutting off *exactly* the audience we hope would remain in rec.radio.amateur.equipment. I have recently read a US Military memo (dated February 1995) that stated that they are renewing their actions in regards to abuse of their computer resources, and I would be willing to extrapolate that once they have dealth with their email channels, that groups with a high abuse (>3%) ratio with respect to for-profit postings will be eliminated from their news server.

Ciao -- Mark

If you already own an HF rig...check into the Ten-Tec 6M transverter
kit. It is optimized for SSB/CW work. Comes complete...I mean complete
with all parts, case, switches, connectors...
Output is about 8 watts. I built one and use it in the car along
with a homebrewed 75 watt amp. Worked several states already.
Price is an unbelievable $99...yes...$99. The deal of the year as far
as I'm concerned. Look into it !
Regards...Hugh VA3TO Toronto

I am looking for a replacement duel band HT antenna. I bought an Icom
W21AT, and I am not impressed with the antenna that came with it.
Anybody know of any good replacements?
Thanks
don - N5RVR

I'd like to hear about Alinco's 6 meter rig(s). Opinions on the rigs
performance and any other likes or dislikes. I'm thinking about buying
the DR-M06.

Howdy from canada! There are a few of us, some working in the industry that use mil gear on the ham bands. The thing that keeps most people off the gear is that you never get a tuning knob! Trying to QSY with a bunch of freq select switches in 100 hz steps is something else! I'm trying to get some 6 meter activity on FM here, and when the solar cycle gets further along, maybe we can try for DX. I'm looking for PRC-68 and PRC-70 radio's. I have a good inventory of service manuals if you ever get in a real jam. 73 from VE6MIL.

I would be interested in any info on the Alinco 580t. I just purchased one
two weeks ago. I havent done any of the mods. I have found one item
about this HT that is a little annoying. It appears there is no automatic
repeater offset as in previous HT's I've owned. ie. Yeasu dual bander
I worked around this by programming my favorite repeaters + offset into
memory. I know its nit picking but my old Yeasu had this feature 8 years
ago. The biggest reason I chose the Alinco over the Yeasu 530 was
the easy mods and the ability to use it on my boat (Marine Freqs)
So far it's been working fine and I will get to the mods very soon, HRO
suggested I dont complete the mods until the 1st two weeks so that
if I had a problem he could just warranty replace it.

Whoa there!!!!!!

Using an Alinco, or virtually any other amateur radio out of bands other than ARES or MARS bands is ILLEGAL!!!!!

We hams are lucky because we can use almost any equipment, homebuilt, factory-made, etc. so long as it's output is ok. HOWEVER, on the Marine band and most others, it is ILLEGAL to use equipment that has not been FCC certified for that band!!!!!! I would bet that most HT's that can be modified for out-of-band Tx will put out perfectly acceptable signals on several bands, however, to transmit on the Marine band with any radio not approved for this could cause problems if you get caught. I do'nt think it is a problem, personally, because most hams realize the technical implications of doing so but OTOH, if you let anybody build/modify their rigs to transmit on regular bands you'd be sure to see lots of problems with splattering, wrong frequencies, etc. I believe that in an emergency you would be well within your rights to use the Alinco to transmit anywhere you could, but be damn sure that it is truly an emergency and that it would be worth a big legal hassle to do so.

>So far it's been working fine and I will get to the mods very soon, HRO
>suggested I dont complete the mods until the 1st two weeks so that
>if I had a problem he could just warranty replace it.

And some advice, if you see any mods involving cutting an orange wire with my anme on it, watch out... I have a DJ-560 (not 580) and there was some confusion between the two, resulting in bad mods getting propagated to every BBs and FTP site you can imagine. The 560 will transmit anywhere it can hear, but can't do 800Mhz or crossband repeat. I don't know about the 580 tho.

Just my 2 cents.

From: drranu@holly.ACNS.ColoState.EDU
Message-ID: <3pjbo9$3a9u@yuma.ACNS.ColoState.EDU>
Source record: 217361

Hi all!
I recently came across a "Golden Eagle 750" linear
amplifier at a garage sale for a real good price.
It looks like it may be a CB linear (AM only) but
I see no reason why I cannot use it for AM 10 meter
operation. Does anyone know if it was made as an
Amateur linear (ha!) or a CB linear?
What I am curious about is, are there any specs anyone
can give me on it? Like freq-range, modes and how long
ago their linears were made, how much they sold for and
such. I would not mind turning a profit on it, I really
have no use for it, except to drive my neighbors crazy! :)

Thanks for any help!

4179. FT-8500 "Personal Computer Control Operation"

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-20 00:00:00 UTC
From: spcecdt@armory.com
Message-ID: <3pjibp$ga7@news.scruz.net>
Source record: 217362

The FT-8500 includes a scheme for "Personal Computer Control Operation", wherein the serial port normally used for packet communication can be used to program/control the transceiver by sending characters that emulate keypresses. I'd like to use this to set up the memories, which will otherwise be rather tedious, since setting each character of the alphanumeric memory tags (which sold me on the FT8500) involves scrolling through every possible character or multiple keypresses on the DTMF keypad. Entering the data at a keyboard will be much easier, especially when I want to rearrange things.
The manual includes all the information neccessary to write an interface to send the false-keypresses, but I'm hoping that someone has already done it. I wrote a utility to do something very similar to this to set the alpha tags on my CD jukebox, sending IR codes to simulate selecting characters with the jog wheel, and it wasn't especially fun :) The manual says:
"There are commercially produced software packages available, and various shareware and freeware programs. To find out more informaton, contact your dealer or check advertisements in current amateur radio journals and publications." So, does anyone know where I might find such a utility?

4180. Mobile Noise Fixes

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-20 00:00:00 UTC
From: cardenas@kaiwan.com
Message-ID: <3pk0o3$jna@kaiwan.kaiwan.com>
Source record: 217363

Skip:

Sorry but I trashed your message about moble noise problems...

MOTOROLA published thousands of copies of a book that was about the elimination of mobile noise. Infact, for years they included a copy with each mobile radio they sold! I looked for my copy to get you a Publication Number but I can't seem to locate my copy now.

Call (or better yet, visit) your local Motorola Service Center and ask one of the Techs if the have a spare copy. If they do, I'm sure they will just give it to you.

One of the ideas I recall was where the +12VDC was fed to the radio via RG-8u coax! The sheild was grounded. They talked of antenna placement, prefered ignition wires, special distributor kits and ground strap placement. It was the best I've seen on the topic. Hope that helps you, Skip.

Rolph:

Don't depend on the ground at the AC outlet. While it is 'ground', electrical noise could still be induced into it, then into your receiver!

The best choice is to sink a ground rod as close to your receiver as possible. Use about #14 house wire, with jacket... keep it as short as possible.

A cold water pipe is the next best choice, especially if it enters the ground near your receiver.

Clean the junctions well with sandpaper or wire brush before you attach your official ground clamp. Once you are assured of a good, clean connection, you can seal it with roofing tar. Leave enough of a stub so you can saw off the sealed part when you want to service the junction, many years from now.

P.S. Avoid hot water pipes and gas pipes too.

Our local Electronics shop has video RF Modulators for about $5 new.
(Torrance Electronics, Torrance, CA.). I've seen them in Nuts and Volts
for about the same price. A little switch on the side selects channel 3 or
4 output and they are quite stable as I beleive they are crystal
controlled.

The Modulator may require a single transistor amp if the range is not quite
there. This would be lot's better than starting from scratch. I think the
maximum power allowed in FCC Part 15 is 100milliwatts for unlicensed
operation? Please check to be sure. The Newsgroup called Rec.Pirate.Radio
(or ?) often mentions low power amplifiers and sources.

I've never tried it but perhaps a Modulator and TV Amplifier will do the
job? Wineguard makes some of the best (DA815 and DA825 come to mind)...
I sold a bunch of pull-out amps for $10 at a local swapmeet. Try some
local TV shops. My last choice would be a Rat Shack amp... if it won't
work for you, perhaps you could get a refund if you keep it looking virgin?

The Modulators are about 3" X 1 1/2" X 1". They have a RCA phone jack
for video input. I don't recall if it has audio in as well. This little
baby should do fine for B&W or color.

From: marc_k@escape.com
Message-ID: <3pk1fi$8jb@beyond.escape.com>
Source record: 217367

Yep, it was made for 27 Mhz use, but it should work for 10 Meters fine.
As most of the 27 Mhz amps out there were filtered poorly (if at all)!,
remember to use a good low pass filter with it.
As for AM only..many old amps had a AM/SSB switch on them.
If the unit does not, and if the unit has a relay to switch the unit in
during transmit, then putting a capacitor across the coil will allow the
amp to be used for SSB in most cases.
Note:some small amps use diode switching;these don't have (or need) a
AM/SSB switch, but they will work in both modes.
An modern example of a diode-switched amp is the "New Mosquito" produced
by an Italian company called CTE.
Rather neat, if you can find one...great for low-power 10 Meter QRP
gear..for example, I have a pair of 10 Meter SSB/CW hand-held
radios..these put out about 2 to 2.5 watts..with the above amp, I get
about 12-14 watts.
The amp BTW, says 7 in for 30 out.
It comes with a nomagraph, it is accurate.
Almost no filtering though!

4189. KenwoodTm-742 800mhz rx??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-21 00:00:00 UTC
From: conklic9391@cobra.uni.edu
Message-ID: <1995May21.194455.43622@cobra.uni.edu>
Source record: 217247

There is a notable dearth of information on using the Kenwood TM-742 (A) for 800-950 Mhz rx. The rf deck has all the parts like the Tm741 for this (of course one must provide an antenna source)- which I assumed would be the case since the radio was purchased before last April's D-day for freedom to listen to radio.

There was a post from JP1LRT a couple of years ago- that is widely distributed on QRZ/ Boston ARC ftp site, etc- but doesn't jive with my radio. The "Older version" described has no relation to mine- and I cannot make sense of the "new version" information.

I plan to attempt the beyond MARS/CAP mod- to see if that allows 800rx, but I would rather leave tx range where it is, rx is already open from factory for all I want on 144 and 440 Mhz, but I would like the 800 rx for helping identify coverage holes for an upcoming 800 system, and to play on 902-28 with stuff.

Anyone with copies or sites for information on these mods?
Tnx in advance es 73

My father just received a DX-160 (Radio Shack) to peak his interest in shortwave with an expectation of moving up into the ham bands... it appears to need some minor work, but I don't have a copy of either the tech manual or schematic.
Can anyone assist?

Thanks.

From: jaywward@gate.net
Message-ID: <3pmbbs$2208@news.gate.net>
Source record: 217372

: The Modulator may require a single transistor amp if the range is not quite
: there. This would be lot's better than starting from scratch. I think the
: maximum power allowed in FCC Part 15 is 100milliwatts for unlicensed
: operation? Please check to be sure. The Newsgroup called Rec.Pirate.Radio
: (or ?) often mentions low power amplifiers and sources.

: I've never tried it but perhaps a Modulator and TV Amplifier will do the
: job? Wineguard makes some of the best (DA815 and DA825 come to mind)...

I tried it Tony, the standard modulator available at RS or others puts out
a LOT of extraneous er stuff :) . If amplified at all it wipes out one or
two channels on either side. A cleaner suggestion is to pickup a commercial
modulator (frequency agile) at a swapmeet for $50 bucks. The one I got
puts out 58dBmV on the freq of your choice, more than enough for 500' of
coverage.

4194. ICOM IC-W21AT & mods feedback requested

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-21 00:00:00 UTC
From: ttait@lynx.dac.neu.edu
Message-ID: <3pmf46$d7r@lynx.dac.neu.edu>
Source record: 217373

I just purchased an Icom IC-W21AT, and it seems to work well. I was curious to know what experiences other users have had, particularly in regards to the wideband rx/tx mods - what coverage was actually obtained? Do the mods work on all models? any drawbacks? Is there a more easily obtainable diode than mentioned?

Also, I get really lowsy reception on 162.55 wx channel w/the rubber duck supplied, but fine on a cheapo scanner antenna - is the duck that narrow band????

Please let me know what you think!

Tim Tait, N1CHZ

> marginal area. I guess it's true that all's relative, but the CH-32
> suits my needs.

I too used to use my Comet Miracle Baby about 95% of the time with my HT until just recently I purchased a Maldol Active Hunter (from HRO at $18.95) and found out how much better it worked than the Miracle Baby I was given this advice right here on this newsgroup, probably in this same thread.

The Active Hunter is about twice the size of the Miracle Baby but it is flexible so it is actually better for not getting caught on things. Actually I had to replace the BNC connector in one of my radio's because the Miracle Baby is hard and it caught on something one time too many and loosened the BNC connector and since it had solder all over it couldn't be tightened.

I also live right below most of the repeaters in my area but as soon as I went across town or even right below them in my car the Miracle Baby would drop out. I'm very amazed with the performance of the Active Hunter it works about three or four times better than the Miracle Baby.

I was so impressed with the Active Hunter I ordered another one the next day for my wife's radio which she is very pleased with also. So I will be selling my Miracle Baby to the highest bidder, how about $20 anyone out there want one?

>333
>

The 902-928MHZ band is a shared ISM band and the amatuer use
agreement is that we will not cause any interferance to the ISM
users. The best best idea would be to change frequency a little
to get out of the cordless band and then modify for higher ERP.

If you are not a licensed HAM, then do not modify this phone.

In article <3plv58$6ip@acmey.gatech.edu>, eew4aql@prism.gatech.edu says...

>Whoa there!!!!!!
>
>Using an Alinco, or virtually any other amateur radio out of bands other th
>an
>ARES or MARS bands is ILLEGAL!!!!!

This note brings up something that I've always wondered about... Exactly what does MARS use in the VHF/UHF spectrum anyway?

I've "used" MARS stations to contact my folks while I was stationed overseas, but it was always HF gear. What does a MARS operator need a VHF HANDHELD for? I really don't know much about the MARS system, but I don't know of any situation where that would be useful.

Somebody please let me know?

Also, now that I'm out of the military, how does one join a MARS net? What can I do?

Regards,

R. T. Perry

4200. HF rig SWR flutuates with power output???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-21 00:00:00 UTC
From: copeland@metronet.com
Message-ID: <3pp3jo$gpo@feenix.metronet.com>
Source record: 217379

I have a TS-820 with a T-1000 antenna tuner, and a roughly 20 foot dipole antenna. I've had some trouble trying to use this on 40m.

I tune it up on 7125 into 50 ohm dummy load at 100 watts. Then adjust the antenna tuner at 5 watts to dipole. After achieving a SWR of 1.1,
I try to crank the power level up. At about 10 watts the SWR suddenly bounces to 5 and no amount of readjusting the antenna tuner will bring it down below 5.

Is this a rig problem? A antenna problem? Or a antenna tuner problem?

I'm new at this so not sure whats happening.

From: dwhite@macd3.telos.com
Message-ID: <3pnlqe$pas@acheron.telos.com>
Source record: 217384

Hello everyone. I just purchased a 757GX for what I thought was a great price ($350). However, I discovered that the receive frequency seems to slightly fluctuate by a few hertz, which is extremely noticeable when listening to a carrier or CW.

Does anyone have any ideas what might be going wrong? I have a suspicion that the previous owner(s) may have tweaked something incorrectly when they had the rig open to perform the rx/tx mods.

Are there any known rx probs with the 757gx?

Also, does anyone know if Yaesu still stocks cosmetic items for these rigs, such as replacement front panels??

Thanks in advance.

I have one for about 2 months and I pretty much like it. I have it hooked up into my car. I feel that the audio could be a little louder (I have it at the max setting in the car because of wind noise,etc). I haven't really tried the 440 portion, but 2m is fine. If you don't want the detachable panel, Icom makes a model without it (and it is a bit small). The radio has some nice features (alphanumeric display if you want) that while I haven't used them all, seem to be a good idea. The standard battery is a little weak (I get under 2 watts with it fully charged) which is probably why Icom advertises it the way it does (5w at 13.5 VDC, not mentioning the base battery). I have it hooked up to the DC power cable in the car, so I get the 5w (you can lower it to .5w, and 1.5w).

I saw some vendors selling them at the Hamfest yesterday. I was able to get mine just below $500 back in March when it first came out. I saw some strange prices at the Hamfest though. The Icom-736 for $1500 cash. I don't think that is new though as the list is close to $2800.

S T R A W B E R R Y M A N T R A R E C O R D S

To get zines distributed, Email us at the Email address below with a sample article and a description of the zine, or maybe even the whole zine, so we can make sure we want to distribute it, and if we say kuul, then send us some copies of the zine and yr in the catalog.
To get yr tapes distributed-Be good, and have nice sound quality. Send a good-sounding master tape and a master cover we can make black and white copies from to the address at the bottom. If you don't send a master cover, we'll just make one. Don't expect great artwork. John's taking drawing class.
We'll see what he can do. At least send a song list. The more you rock, the better. No Extreme-Hole Hearted Mr. Big shlock rock, please. We don't want Country or Offspring or Contemporary or R & B or Reggae or Rap tapes. So don't send them to us. If we don't like them, we put them away. Have any or all (?) of the following elements in yr music: rock, catchy rock, punk, or hardcore. Don't be lame, and, like we said, have nice sound quality.

Our royalty policy is real simple: When we distribute you, for each copy of the album you sell through us, (whether it's on vinyl or tape or cd) you get a dollar. Our royalty policy on zines is simple, too. You keep 70% of the money, we keep 30% of the money. If we (as in you and us) decide yr zine will be two dollars, we keep 60 cents for each sold zine. (60 cents just about covers postage costs. the zine department is really non-profit) The remaining $1.40 is yours! Because of this policy, we don't buy wholesale copies of zines in advance. mainly cos it's risky to us and yr zine gets more money this way.

*Online Zines: Don't wanna wait for snail mail to bring the zine to you?
Kuul! We'll Email it to you. Just send the money to the label address telling what zine you want and where we Email the zine to so you can download

it-and
the zine will be yours within seconds of receiving the money via a
download
file. Available when the catalog specifies "Online Version." Some zines
are
available Online only, some only by mail, some both. The royalty policies
for
Online Zines remain the same. (yes, postage costs don't exist when you
send
online zines, but really, it's not fair to the non-online zines. Some of
those zines have pictures and stuff, especially art/comic-type zines,
which
would be way impossible to do online. They don't have the advantage of not
paying for copying costs and postage. Just cos they have pix doesn't mean
they should lose money.)

SoundClips from Strawberry Mantra Records. Download 20-45 second long
samples as Wave Files from Strawberry Mantra releases.

Email the screen name below to request a SoundClip. I M P O R T A N
T!!!-Must
have a sound card to play these things. If you need help, after getting yr
clip, email me, i'll do what i can. Realize that mucho sound quality has
to
be sacrificed to make SoundClips possible, and that SoundClips do not at
ALL
represent the sound quality of Strawberry Mantra releases. If AOL said
"Welcome" when you signed on, then you probably, (unless yr sound runs
through that internal PC speaker that the modem noise comes through) can
play
these things.

All prices include tax and shipping and handling.

If you run a little label yrself, contact us. We'll trade tapes and
stuff.
We make sure the sound quality is nice on our releases. And, to smaller
bands, four-track recordings are just fine. There's a lot you can do with
four track recordings to make them sound really nice. We focus on the
music.
That's why we give the bands the extra money, to bring out new material.
It's
really money out of our pockets. But we're nice. We just want to make sure
we
don't make ourselves look bad by releasing poor-quality recordings. That's
all we ask. So talk to us! See ya later.
From John Mulhausen and Andrew Bales-Owners

Email SbryMantra@aol.com
Send zines, tapes and orders (cheks payable to John Mulhausen) to:
Strawberry Mantra Records
P.O. Box 701805

Tulsa, OK 74170-1805

COMING SOON
about 20 new albums are scheduled to be sent to us
The Video- a VHS tape w/ atticus finch, john, and others live. sketches, and
behind the scenes looks at kitty vamp and strawberry mantra records. probably
will cost 7 bux
Psychedelicatessen- Strawberry Mantra is putting together a compilation that
will be sent to 14 eager radio stations. (scary) and will include at least one
song from every band we distribute. (cept the ones on the kitty vamp
compilation, of course) and if yr on the label yr on the comp. and it's going
to 12 radio stations who happen to be rather interested in us. scary....
zines galore. zines zines zines
tell me right now if you want to be updated. we're gonna bring out good
stuff, but give us a second, the label is as of now, about 2 weeks old.

Gabe,

Radio Shack *DOES* sell GMRS radios (151/451 MHz) radios, and they are
GREAT for use because they have a server mile range on them. They are
$130 each I think, not exactly sure, but ask them for a "GMRS" radio on
the "Blue-Dot", "Red-Dot" or "Yellow Star" frequency; the "Green-Dot"
is 151.6250 MHz and is a well known frequency, so you should steer away
from Green-Dot radios.

I am looking for anywone that has a copy of the manual for the
TK-801S mobile unit. It has 6 channels and is EPROM programmed. I
am interested in tuning it down from 453MHz to the ham bands.

I would sincerely appreciate, and would be willing to pay postage
for, a Xerox copy of the manual's main parts covering programming
and tuning.

My e-Mail address is Gary.Burcalow@shotsfired.com.

OK... here's a wierd one. I'm thinking about trying to setup a mobile packet rig. I've got a 2 meter HT and a Psion 3a (which is a palmtop, for anyone interested...). Has anyone ever tried to connect these two together? What kind of TNC would I need to buy/build? Has anyone ever tried this? I have heard of some people doing this kind of thing with a laptop, but never with a palmtop.

Ideas anyone?

Regards,

R. T. Perry, KB2JAC

: Gabe,

: Radio Shack *DOES* sell GMRS radios (151/451 MHz) radios, and they are
: GREAT for use because they have a server mile range on them. They are
: $130 each I think, not exactly sure, but ask them for a "GMRS" radio on
: the "Blue-Dot", "Red-Dot" or "Yellow Star" frequency; the "Green-Dot"
: is 151.6250 MHz and is a well known frequency, so you should steer away
: from Green-Dot radios.

Whoa there.... GMRS is a UHF service, 462 MHz, and is NOT for commercial
use anymore. This is NOT a GMRS application, although Radio Shack does
sell a GMRS radio. They do sell a business band radio on 151.625 MHZ, and
you can find Motorola P10s (and SP10s) fairly cheaply from a large number
of mail order stores on 154.57 and 154.6. All these must be licensed!
Check with a local commercial radio store, they may be able to help and
get something cheaply.

>--
I'm not familiar with the Yaesu SP-7, but the radio shack power/amplified speaker is roughly $25 and I'm quite pleased with it. You just hook it up to your car's d.c. power. I use one for my HT. Another route you might take for less money, is to go to your local ham swap meet and look for some old external mobile speakers. I picked up an old motorola and an old GE external mobile speakers at a swap meet. I have one of them connected to a handheld scanner in my vehicle, and this speaker worked just as well as the radio shack one...

Hope this helps,

I searched high and low, including Rat Shack, for d.c. power barrel plug for the FT-530, and noone had the size for this radio...I ended up paying $7.95 at HRO for just the plug and wire (model# EDC-6). You mentioned that you made your cord with a regulator...is this a right angle plug? What size plug did you buy? I understand the plug for the HT is 3.5mm OD. Did you find this size? I'd like to get another power cord, but would like to pay less than eight bucks for one...any info is appreciated.

>I'm new at this so not sure whats happening.

The dipole should be at least full half-wave on the lowest band you
want to operate on. For 40m that would be about 66 feet. You could
try feeding the dipole a a longwire to the tuner.

You would then use the tuner if you wanted to work less than 40m using
the same antenna.

Hi,
Does he need a call to post here? Didn't know you needed a license for
usenet :-)

I picked up what appears to be a TWT in this class on Saturday at a swap meet.
It's got a WR90 output flange so it appears to be at least close to 10Ghz.
It came cheap: $10, but w/o a power supply. So I'm looking for data sheets
or even a complete supply for this. It is a Teledyne TWT. Well, if it's not
usable as is, it is at least worth $10 for the SMA connectors and other
hardware!

A spectrum analyzer would be a great find!

I bought a 10.5-11.5 Ghz circulator for $4 a few weeks ago. You can nudge these
slightly, I'm told.

> is not very good.

I agree the stock DJ580 antenna can be improved upon considerably, but in the case of my particular 580, I seldom use a better antenna. The reason is that the VHF side picks up internal noise from the digital circuitry and causes the squelch to "chatter" in a rhythmic fashion, until the particular spur drifts off to some other frequency. It can be heard on another radio if its antenna is held right next to the 580 keypad. Fortunately it's not very stable, or the radio would be almost unusable on those frequencies. If I use the stock antenna, it's annoying but tolerable. If I put a better antenna on, it becomes untolerable.

I sent the radio back to Alinco and they claimed to have resoldered some joints and shields, but I saw little, if any, difference. Except for this, I like the radio very much. One of these days, I may tear into it myself and see if I can find the cause. I have a couple friends who have 580's and their radios do this but only rarely. Mine is much worse.

Joe,

Be VERY CAREFUL when disassembling a TWT... TWT's Normally
contain internal components made from Berylium Oxides which are
HIGHLY TOXIC if inhaled or ingested. Because of this, these tubes
are normally considered hazardous waste and require special
handling for disposal and are generally not such a great deal
when you are the one that has to get rid of the thing.

73s,

Neil N0PFZ

>
>73, Jack WB3U

Jack's advice is on-track, however, it should not be necessary to use a 2W resistor, since the HT will deliver less than 1W to a load of higher than 8 ohms. The output of the HT audio amplifier is a constant voltage. The power delivered to a resistive load from a constant voltage source (of course, speakers aren't resistive loads, but they are analyzed as such) is V^2/R. So to achieve the rating of "1 Watt into 8 Ohms", the voltage out of the HT amplifier would be sqrt(8) = 2.82 V (RMS). This figure can be used as a basis to design an attenuator to reduce the power to the headphones.

Probably the best choice here is a single resistor in series. Randy wrote that he wanted 12 mW at the headphones. Assuming the impedance of the phones is 16 ohms, the voltage required would be sqrt(.012 * 16) = 438 mV. The HT outputs 2.82V, so the resistor must drop the remaining 2.4V. The current through both the resistor and the phones is the same, so the ratio of voltage will be the same as the ratio of resistance. So the resistor needs to be (2400 * 16) / 438 = 37.96 ohms. Incidentally, the power dissipated in the resistor would be (2.4)^2/38 = 151 mW. So a 1/4 W resistor should be suitable. 39 ohms is the closest standard value.

The problem of a loud pop when the squelch opens and closes is because many HT's turn off the audio amplifier while the squelch is closed to save the batteries. When the amplifier switches on again, the coupling capacitor between the amplifier and the speaker must recharge. Since this capacitor is sized for the 8 ohm speaker (large) it will take a long time to charge through the headphones. Some HT's (I'm not familiar with the HTX-202 though) have a menu option to disable this feature, preventing the pop at the expense of more power draw. Placing a small capacitor in series with the headphones will limit the "pop" (although, depending on amplifier design, it may become more of a "snap"). The capacitor should be as small as possible to pass the lowest

required audio frequency. The impedance of a capacitor is 1/(2*pi*f*C), so for f=300 Hz, X=55 (39+16) ohms, C=1/(2*pi*300*55) = 9.65 uF. The HT probably has upwards of 100 uF in there stock, so the external capacitor would be almost all of the impedance. The capacitor value would probably need to be adjusted to suit your taste in tonal quality.

Anyway, there's the psuedo-scientific approach. Just grab the first resistor you find with a black or brown multiplier band, though, and it will probably be just as good.

4245. Drake TR-4C distortion

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-22 00:00:00 UTC
From: "Colin Schmutter"
Message-ID: <3pr3ll$m88@chopin.bcit.bc.ca>
Source record: 217278

I picked up a Drake TR-4C about 2 weeks ago.

I have received reports of a slight audio distortion while transmitting.

The reports indicate that it may be RF getting into the microphone.

I have checked the obvious areas such as the condition of the tubes, microphone cable and grounding, but nothing has provided a cure.

Listening to my own signal with a monitor receiver I cannot detect the distortion on the SSB modes but on AM the first syllable of each word definitely distorts.

Has anyone else experienced this problem with the TR-4C and know of a cure?

Please reply to cschmutter@bcit.bc.ca

Hi Steve-

I saw one with an AC power supply at a recent hamfest that was
offered at $150, in working condition. I don't know if it sold
or not, though.

Those Drake tube rigs are GREAT, in my opinion. If you decide not
to keep it, please email me and we'll talk trade!

Source record: 217280

Followup to my previous post in here:

All in all, I like the FT-2500M. It's solid, the manual is good, and in general, with my limited use so far I like it. The only thing I miss or haven't figured out how to do yet, is directly dial in the freq I want. I can get close by hitting the MHz switch, using the up/down or the tuning dial to quickly switch to the MHz setting, hit the MHz to get the KHz part back and then tune up or down to the desired setting. However, I would really like to be able to just key in on the DTMF pad, for example, 6520 and have it go to 146.520 MHz. That's the only thing so far. I also like being able to use 4 chars to ID my settings in memory rather than having to remember which is the private repeater so I don't use it. The limit of only 4 chars is understandable, I guess, though I would have thought 5 would be the limit (14 6 .5 2 0 in the example above). Makes for some interesting labels, for example if I get stopped by the cops, I better hope he doesn't think I'm a drug dealer, I've got SNOW for Snowbank Mountain.

Now to make the packet connection to the mic connector. At least we have the tools here at work if I can find a shielded cable to work....

Chautauqua County Amateur FM Association
If all else fails, Amateur Radio
PO Box 81
Jamestown, NY 14702-0081

The Chautauqua County Amateur FM Association will operate several stations as Special Events Stations for the Lucille Ball Festival of New Comedy, Memorial Day Weekend from Jamestown, NY.
LucyFest is a three day festival celebrating the life and career of the counties most famous Native, Lucille Ball. Many new comedians have found their start at LucyFest, including Ellen Degeneress, Paula Poundstone, and Lew Black.
The CCAFMA stations will operate from the Third Floor of the Reg' Lenna Civic Center. This theater was Lucy's first exposure to vaudville comedy in the early 1930's. Be sure to tune in, as some of the performers are expected to take to the Ham Bands.

The stations will operate Friday, May 26-Sunday May 28 on the following schedual.

Friday 9:00 PM EDT (0100 Z):
146.790 (-) Phone Opening Net. CCAFMA Regular net time. Net Control, N2VQD
145.07 Packet (KB2RLK-2) BBS Opens.
Connect direct or thru KB2OBB BBS. Leave a message for QSL
Internet IRC #LucyFest
HF Operating location, operators, and other Station Information
Internet ftp://ftp.epix.net/incomming
Slow Scan TV Snapshots in GIF.TIF format scheduled to be availble.

Saturday and Sunday 8:00 am (1200Z) - 5:00 PM (2100Z) - Voice Operation
146.88 (-) Phone-KB2RLK
HF Phone- N2VQD
* Due to condition reporets, the HF station will not be operating on a set frequency. Look for us in the General Portions of the 80,40,20,10 Meter bands, or check the Packet DX Cluster or the #LucyFest IRC channel.

For a Commemoritive QSL, (Supplies are limited, priority will go to Voice, then Packet, then Internet QSO's) Send an SASE to

Hi Derrick,
I used to have a 757 GXII. The freq. would fluctuate for about 10 minutes after being turned on, then settle down, more or less. The Yaesu service manual for it implied this was normal unfortunately :-). Other than that, it was a good rig, with an excellent if shift control.-- 73 de Barry

Most newer HF rigs have built-in computing VSWR meters and optional speech synthesisers. May I suggest that you contact the main manufacturers. I think you have a feature that they could probably implement quite easily in their next designs. It may not help you now, but it must be worth suggesting..

Well, I'd pay a reasonable price for a copper cactus j-pole if it were nicely made. I would think that 20 or 30 dollars would not be too much. Many of us either do not have the tools and-or time to fool with it. I know, it doesn't take a lot of tools but if you do not already have them then you'll spend a lot of money for something you might use one time. Go for it. I think they will sell like hotcakes.

Marco,

Also tell your friend not to overlook the Continous variable bandwidth tuning the 751 A already has. It can act like he has a 1.8 KHz filter installed.
I often wonder if manufacturers would be better off dropping PBT for fixed bandwidth filters. Installing PBT is very expensive, and it seems most want the fixed bandwidth filters in place of the PBT anyway.

I bought software for my Yaesu 51 at Dayton. It performs any kepad
function via computer. It now takes about 30 seconds to do what used to
take an hour and a half. You can contact the publisher here on the net.
E-mail me for his address if you're interested. It's price is very
reasonable and the Windows based software is great.

: paying $7.95 at HRO for just the plug and wire (model# EDC-6). You
: mentioned that you made your cord with a regulator...is this a right
: angle plug? What size plug did you buy? I understand the plug for the
: HT is 3.5mm OD. Did you find this size? I'd like to get another power
: cord, but would like to pay less than eight bucks for one...any info is
: appreciated.

Yaesu (and many others) have learned from Sony: make the power cord connection a non-standard size, so that you can rake people over the coals for accessories. :-(

The possible solutions are (1) buy the manufacturer plug (the ones that may be the same size for other manufacturers will likewise be marked up beyond all sense), (2) replace the internal jack with something standard, invalidating your warantee, or (3) buy a (preferably alkaline) battery pack and add a molex connector to allow external power in that way. Done properly, you can still load up the pack with AA's and run on them when you need to, and it hardly looks ugly at all :-)

Sounds like you might have a breakdown (electrical) or short somewhere.
Check for bad connections. SWR can vary with power levels depending
on your meter and surrounding structures. I'd first check your
tuner then check the coax and antenna connections. You might want
to borrow an SWR meter and put it after the tuner and try your
test. Don't worry about the external SWR reading but watch it as
you increase power. If it changes (drastically) then put the SWR
meter at the antenna and do the same thing. If there is no change
then check your tuner.

Source record: 217311

I've been looking into handheld transcievers,
and have been trying to get a sense of which vendors
offer the best facilities for computer interaction.
(By this I just mean computer controlled loads, restores,
and button pushing, not packet or data support (though
an interesting topic in itself)).

The Yaesu FT-51 evidently has a clone facility that can
be used to load and restore the unit. Clone facilities
of some sort seem to be available from other vendors too.

Does anyone have any more detailed information about the
range of possibilities?

I'm interested in finding out about:

a) interface hardware requirements
b) memory backup possibilities
c) computer control (as found in some scanners)
d) quality of documentation from a software generation
standpoint

I've gotten spoiled in terms of computer control by
the AR8000 scanner, and am curious about what's available
in this segment of the market...

I bet you would feel a lot better if you new that your nieghbor
knew the basics of RF energy, as he was bouncing 10 watts of
10 GHZ energy of your house walls and backyard. The basic request
led me to believe that he may not have any experience with this
equipment and could pose a health hazard to himself and others.

Callsign request would have allowed me to know his QTH and would
have been able to recomend an experienced user in this band. I am
all for new blood in Ham Radio and always encourage newbies.

Have a nice day VE7AHL

The radios referred to above are not all "GMRS" band allocations. GMRS refers only to ten specific frequencies in the 451-452 MHz range, some of which may be operated simplex, some with repeaters, and some both. There is an FCC license required and allowed for PERSONAL use only, unless grandfathered from years past. A 50 watt transmitting limit is imposed here. I think the license is about $40.

The radios referred to in the 151 MHz range are classified as BUSINESS only and are licensed as such by the FCC. Radio Shack sells models of both business band and personal GMRS band, but I would suggest looking into reputable manufacturers, such as Motorola, GE, or Johnson. You can find these in the yellow pages of a major metropolatin area phone book under Radio-Business-2Way.

Many electronic distributors are now also offering a 10 channel 2 watt GMRS handheld manufactured by Maxon. While the name may not be as reputable, it may serve the purpose for less money.

>73 and thanks,
>Marco

Icom does not offer a 1.8KHz filter. His best bet might be to look at a third party filter. International Radio and Computers -- advertise in QST/CQ from time to time -- sells a drop in 2.1KHz filter that will directly replace the FL-44A in the 3rd IF. Also a 2.1 KHz filter for the 2nd (9MHz) IF that is a "wire-in". These are good filters -- I use them in a 781.

These REPLACE the existing filters, and unless you do a diode switching mod of some sort, you can't switch between these and the stock filters. Also, you have to reset the carrier oscillator setpoints, so switching is probably not very practical, anyway.

The Yaesu FT-2500M has the clone facility that lets you copy
the settings to another FT-2500M. Wonder if that means it
can also be used for controlling it?

The classic 6 meter ssb/cw rigs are the Drake TR6 and the Heath SB-110. Each runs close to 200 watts input. The Drake is usually very hard to find because it is a real treasure to 6m enthusiasts. Heath SB-110s are more common and work just fine. I have put in years on six using a ?110 with very good luck.

Don?t think you?ll find much AM activity left on 6, though I rarely tuned up higher in the band where the AM guys hang out. The SSB/CW stuff is all down at the bottom edge.

Gee... maybe something happened to them. I bought filters from them last year and they were very courteous and helpful. I got the filters, plugged them in, and they work great. I think this is not an uncommon experience with them -- I know there are lots of people on the net who like their stuff. I hope they haven't gone out of business.

if you aren't buying the z1a because of the display mike feature, ask around
about the new W31a dual band. I have a brochure and its in the current HRO
catalogue, but availability is not being quoted yet (pending fcc approv.?). The
W31a is a lot like the z1a, ie it has alphanumeric display and full size
back-lit keys, w/o removal mike panel, and is super slim (1.1" vs z1a~1.5")
a la yaesu 51r.

On my local 440 repeater net the other night someone mentioned that they now
have the PC s/w to clone yaesu ft/11, ft/51, which they also thought worked
with some yeasu mobiles. They just got the s/w and I had the impression that it
came from Yaesu? I also remember seeing a post here a while back to that
effect.

I have an SG-2000 on my boat that I would like to be able to use earphones with (and turn off the speaker). The standard audio out connection gets turned off with the speaker. However the mic jack is designed for a phone type handset so I figured I could use that. However the audio output into the earphones is too low, at full volume it is barely audible. This happens with both low impedence and high impedence phones. Does anyone know what the audio characteristics of the typical handset type microphones are?

I have a Miland 70-154B commercial HT that is collecting dust. This is a VHF synthesized 16 channel unit. I have been told that this particular unit will only operate within specs between 150-174 MHz but that may or may not be true. The package includes the radio, two REALLY LONG LIFE (13.2v 1000mah) batteries, a leather case, and a quick charger. In terms of appearance, there are few scratches on the front of the case, but other than that it's perfect. The radio has a digital display and a DTMF keypad. Scanning and priority channel monitoring are supported. It is capable of 5w (high) and 1w (low). The price is $300. Anyone interested can reach me via email at: hillgen@eden.rutgers.edu

TNX,
Jay

4307. need info folded dipole broadband antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: fiscon@ix.netcom.com
Message-ID: <3pvilf$3gg@ixnews2.ix.netcom.com>
Source record: 217201

I'm trying to build an antenna like the BW Barker Williamson folded dipole broadband antenna. The BW antenna is a 90 foot folded dipole with 18 inch spreaders, a 1:1 balun and an 800 ohm termination network. It offers 2-30 mhz coverage with swr <2:1. Does anyone know of a source of info such as arrl or magazine articles etc. with the theory behind this antenna.The arrl antenna handbook does not describe a folded dipole with this kind of frequency coverage.
How is the terminating resistance determined?
Any help would be appreciated.

4308. HELP,JOHNSON 900MHz 242-8591 programming?

Newsgroup: rec.radio.amateur.equipment

From: rpmackin@ashley.business.uwo.ca
Message-ID: <3pv9tp$ed5@falcon.ccs.uwo.ca>
Source record: 217202

A friend of mine was in Rochester and purchased a handie made by E.F. Johnson.
It is 900MHz, both trunked and conventional.
It is VERY well built, intrinsically safe, and seems to have some nice
features.

I know a Johnson dealer here who told me they all use the same programming
apparatus, but specific software for the each type of radio.

Can anyone help with this? He wants to put in a few 900MHz simplex frequencies,
as well as the local 900MHz repeater freq.

ANY help would be very much appreciated.

>af4s@bcfreenet.seflin.lib.fl.us (Steven Gordon) writes:

>> Am considering buying the Standard C5718DA dual band mobile. I hear
>it
>> has great intermod rejection...

This appears to be the latest trend in advertising. Say it has
"superb intermod rejection" when in fact, the claim is totally
baseless. Standard claims this for virtually every radio they make!
Have you seen their ads over the past year?

Great intermod rejection where? I had the 2-meter version (C1208DA)
of the above rig. It DID have intermod problems. In the 2-meter
band it was "acceptable". On UHF (receive only) it was often useless
due to extreme intermod. Overall, it was a good (not great) radio.
I guess that's their refinition of "superb".

If you want "superb intermod rejection", buy a Radio Shack HTX202 HT
or the Yaesu FT2500M mobile.

Can anyone comment (based on actual experience) on the rest of the
Standard line? Thanks.

>
>>Does anyone have any comments on the new Icom Z1A dual band ht?
>If you don't want the detachable panel, Icom
>makes a model without it...

I echo all of Jonathon's comments...I've gotten IC-W31A without the detachable panel (by choice) and paid $419 (from KLI) at the Owego hamfest. I love the humanfactors interface that it has, very user friendly for this new ham. The standard battery is 4.8 volt, which gives about two watts o/p, so I bought the cigarette lighter adapter for my use from the plane, car, and boat. The 13.5 volt battery is $120! I also added an ALR 800 "hot rod" antenna package to help me "hit" the repeaters from remote locations. I've installed an airframe mounted permanent antenna for bird to get the signal outside of all the aluminum. This will probably require a low power setting to avoid hitting EVERY repeater on the frequency!

The rational for my purchase of the IC-W31A was:

1) My ham "mentor" has an IC-W21AT and she loves it! So does her husband!
2) The keypad is lighted for night use...its bright enough to help you read the repeater book and find the frequency you need in an emergency!
3) ICOM has an excellent reputation in the aviation handheld market. The marine people seem to think well of the ICOM line as well.

4313. Re: Questions on Dentron 1200 L linear

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <3pvf8p$dad@newsbf02.news.aol.com>
Source record: 217207

Hi Kevin,

>1) Does Dentron still exist? I can't find it in the advertisers indexes in the usual magazines. Some of the Ameritron gear looks similar, and is Ameritron related to MFJ? (Clue, I've always been a 'barefoot' kind of guy - so I haven't paid a lot of attention to the amplifier world)<

No. Dentron was a different company that went bankrupt years before Ameritron started. Ameritron and Amp supply were staarted by the old principle of Dentron, Dennis Had, with financing from Prime Instruments (whom I worked for) and when the bills weren't paid Prime took Ameritron away. So some of the features may look the same but all "Dentron" influences stopped almost as soon as they started.

>2) Does anyone know how the 10 meter mod is done? This one wasn't modified, and if Dentron isn't still around I'll need to get the data someplace. Will I need switch parts?<

Probably you will need switch parts, but I am not positive.

>3) Realistic output levels? It talks about a kilowatt or so input, I'm presuming that the output will run 500-600w - which is all I'm really looking for, 6 db or so up from my regular output of 100 watts and let the exciter loaf at 10 watts on SSTV.<

With the 572's it should do that.

>4) I'm curious as to whether this amp can switch quick enough to use for PACTOR. I mostly run barefoot at 25 watts or so for that mode, but sometimes it would be useful to run some more (again, I'd probably let the exciter loaf and only run about half power). I don't think I'd run it with AMTOR, as that switching cycle seems like it would really be rough on relays, but PACTOR doesn't seem quite so bad. I haven't had the case off yet - does anyone know what kind of relay is used for switching?<

The relay used in that amp will switch modes in around 10 to 12 mS.

4314. Re: PK900 Ground Loop/AC HUM

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <3pvf96$dao@newsbf02.news.aol.com>
Source record: 217208

The hum is a ground loop caused by the power supply and mic cables having a common ground through the Packets chassis grounds. Some supply's are better isolated than others. Grounding the Packet to the rig with a short heavy strap can also help, but using a ground isolated PS is usually best.73 Tom W8JI

4315. Re: MFJ Hi-Q vs AEA Iso-Loop

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <3pvf9e$daq@newsbf02.news.aol.com>
Source record: 217209

>I have a AEA loop and have used the MFJ one at a friends. The one big difference is the AEA loop is a much higher quality product.<

I have both antennas. But the MFJ in a side by side test actually works slightly better than the AEA! Although I agree the AEA looks better.

>In addition it has a much larger capacitor than the MFJ does. The plate spacing is greater because higher voltages are generated. This means the antenna is higher Q.<

Actually the AEA capacitor hurts the Q. It is longer and thicker, and has more bulk, but the length actually hurts the Q. The best capacitor is as square sized as possible. Long capacitors add series reactance, and that lowers Q drastically. The plate spacing is only part of the voltage rating, the smoothness of the plates is also very important. My AEA loop has sharp edges on the capacitor, and that lowers the voltage breakdown drastically.

If you want to measure the Q, do a simple SWR test as you move the transmitter freq.. Set both loops to the same freq, and first test one and then the other for BW using the same coax, SWR meter, and antenna mounting position. If you do this test, and if the loops are made the same way they were a couple years ago, the MFJ will be sharper. That indicates higher Q and efficiency.

Subject: 800mhz for the Icom 2700H

We have found away to bring 800 mhz frequences to the new IC-2700H dual band mobile.

I would like to know how many people would be interested in this mod. It's cost would be around $100.00 and would consist of all parts and simple to follow instructions. It's range will go to about 830 mhz-950 mhz!

Please email at kirby@skypoint.com and I will email you back when we are ready to ship. This is just for a count and there is no obligation.

Subject: copper pipe j-pole

Well, I'd pay a reasonable price for a copper cactus j-pole if it were nicely made. I would think that 20 or 30 dollars would not be too much. Many of us either do not have the tools and-or time to fool with it. I

know, it doesn't take a lot of tools but if you do not already have them
then you'll spend a lot of money for something you might use one time.
Go for it. I think they will sell like hotcakes.

Subject: Yaesu FT-2500M Any info please.

Followup to my previous post in here:

All in all, I like the FT-2500M. It's solid, the manual is good, and in
general, with my limited use so far I like it. The only thing I miss
or haven't figured out how to do yet, is directly dial in the freq
I want. I can get close by hitting the MHz switch, using the up/down or
the tuning dial to quickly switch to the MHz setting, hit the MHz to get the
KHz part back and then tune up or down to the desired setting. However,
I would really like to be able to just key in on the DTMF pad, for example,
6520 and have it go to 146.520 MHz. That's the only thing so far. I also
like being able to use 4 chars to ID my settings in memory rather than
having to remember which is the private repeater so I don't use it. The
limit of only 4 chars is understandable, I guess, though I would have

thought 5 would be the limit (14 6 .5 2 0 in the example above). Makes
for some interesting labels, for example if I get stopped by the cops, I
better hope he doesn't think I'm a drug dealer, I've got SNOW for Snowbank
Mountain.

Now to make the packet connection to the mic connector. At least we have
the tools here at work if I can find a shielded cable to work....

4317. IC-T41A Squelch Tail

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: hideg.1@nd.edu
Message-ID: <hideg.1-2405950914240001@hideg.cc.nd.edu>
Source record: 217211

I picked up an IC-T41A at the Dayton Hamvention this year.

I have noticed that the squelch tail on it (the period of time between the input signal ceasing and the squelch closing) seems longer on this radio than on any other VHF/UHF radio I've owned (and I've owned many).

Does anyone know why this squelch tail is so long? Is there an internal adjustment for it?

Thanks.

>I have a TS-820 with a T-1000 antenna tuner, and a roughly 20 foot dipole
>antenna. I've had some trouble trying to use this on 40m.

>I tune it up on 7125 into 50 ohm dummy load at 100 watts. Then adjust the
>antenna tuner at 5 watts to dipole. After achieving a SWR of 1.1,
>I try to crank the power level up. At about 10 watts the SWR suddenly
>bounces to 5 and no amount of readjusting the antenna tuner will bring it
>down below 5.

>Is this a rig problem? A antenna problem? Or a antenna tuner problem?

>I'm new at this so not sure whats happening.

I have also had problems with SWR bridges at low power settings.
I once hooked a 30M QRP transmitter (2.5 watts) up to a home built
SWR meter and a 50 ohm load and measured no reflected power. No
problem. I then proceed to connect to 100 ohm and still measured 1:1
SWR! The design I used was one I found in some ARRL QRP manual that
provided a proper load to the transmiter, while using a small portion
of the RF applied across a 50 ohm wetstone bridge configuration, one
leg of which included the antenna.

The problem I had was that I was dealing with small voltages
rectified by a diode with a nominal 0.5 to 0.7v drop. The diode
drop ate most of my available voltage, which, was only about 1v
peak to begin with.

My problem was cured by connecting the RF bridge directly to the
output of the transmitter. At 2.5 watts into no load, this gave me
about 7 volts to work with across the detector. This increased the
mismatch the transmitter will see during tune up, but at least now
I get a much better picture of my true antenna situation.

You are probably dealing with a similiar situation.

Not quite sure if this is what you are asking, but...

I own and have owned the Yeasu FT2500M mobile, Kenwood 732 and 741, and two Standard 5718s. Currently, only the Standards and 742 are in operation...The Standard 5718, hands down, has better intermod "rejection" in the 144MHz band...this is why they are in operation in our car and sport utility vehicle. Albeit, there seems to be more intermod on the 440MHz side than the Kenwood or Yeasu.(?) The Yeasu and Kenwood models are almost un-usable in the city - Indianapolis- (downtown) on the 144MHz band. I have "loaned" the Yeasu to a friend who lives in a rural area, he swears by its operations. The 732 was similar in intermod rejection to the 742...the functional operations of the Kenwwoods seemed to have more inherent ease, learning curve not as steep compared to the Standards and Yeasu.

The 742 has been on-line in base, cross-band repeater mode - controlled by an external controller after isolating the raw audio output for the controller rx audio input - for almost a year. This is near full-duty! An external fan helps, though. Unbelievable, but, I have never had a problem with the 742. The Standards had problems with VCO modules which Standard has made right/corrected....The Yeasu has been so sensitive to ignition spikes that I had to remove it from mobile operation - now my friend's base radio.

For what it is worth, that is my experience.

Jeffrey

: thanks - ruediger - df2gr

Atlas had a booth at the Dayton Hamvention. I stopped by and looked
at their new radio. I honestly don't recall if the model number was 400x.
It is a small radio, very similar in appearance to the 180 family
with some improvements to the front panel. The tuning knob and
display are better. No comment on performance.

>Since I won't be using the fancy nicrom wire MOD,
>does anyone have an idea on changing the Plate parasitic choke ?
>Thanks, w5robert@blkbox.com
>-I have already gone in and grounded the grids directly.-

Hello Robert,

I think you will find the original chokes are more than adequate if you grounded the grids directly to the chassis at each grid pin. That grounding would move the frequency that the amp tries to oscillate at much higher in frequency, where more of the resistor and less of the coil in the suppressor loads the circuit. I assume you have the original parts. Don't be parasitic paranoid. They will not instantly roast everything in the amplifier and don't cause many of the problems some people allude to.

One crude but effective way to test a linear amplifier for parasitics (and

other instability) is to key the amplifier with no drive and no load at the
highest HV you ever expect to have and rotate the tuning and loading controls through their ranges in every position of the bandswitch. If you see a sudden increase in grid current or a change in plate current kill the power.

Without a spectrum analyzer you may not be able to determine the exact frequency of the oscillation, but if the tuning capacitor mainly affects the oscillation, and the bandswitch doesn't, it is probably on VHF. If the bandswitch and tuning and loading caps all affect the oscillation it is probably on or near the operating frequency, and if the loading cap has the biggest effect, and the bandswitch has no effect, it is at VLF or certainly below the operating frequency.

I would expect the 3-500's with the grids correctly grounded right at the socket pin with zero lead length would "try" to oscillate only at VHF in the 100 MHz or slightly higher region.

The idea is to divert as much current through the resistors in the suppressors at 100 MHz (in this example) without diverting any current at the operating frequency through the resistors. That will keep the tank Q as high as possible at the operating frequency, and as low as possible where the oscillation try's to occur.

You will probably have enough frequency spread that a simple suppressor will be enough. The oscillating frequency would be more than 3 times the highest operating frequency. You should use the least number of turns that stabilizes the amplifier. Too many turns will cause

10 meter heating of the resistors, too few turns will cause insufficient loading at 100 MHz.

In stubborn cases (3CX1200A and D7, 3-1000Z, 572B, etc.) it may require that the coil in the parasitic suppressor is parallel tuned with a

small cap to the frequency of the parasitic. Another way is to series resonate the resistor path at the parasitic frequency with a series L/C/R circuit. These methods will dramatically increase the loading of the anode by the resistor without compromising HF performance.

One final word of caution, if you ever replace the resistors in a suppressor, cut a sample of the replacement part open and inspect it! If it has a ceramic core it is probably constructed wound with a carbon or metalized spiral! These resistors are very poor when used in a suppressor unless the reactance cause by the winding is tuned out with a small series capacitor! Nearly ALL resistors are made that way, and the correct resistors must be special ordered. But a sample should always be examined or measured for inductance. Even alleged "non-inductive" resistors can fail this test! If you draw it out on paper, you

will see any inductance in the resistor decreases the VHF loading drastically.

>How is the terminating resistance determined?
>Any help would be appreciated.

I'm not the resident guru on the theory part, I'll leave that to the other folks.

I know a few MARS ops who used this antenna. And in fact, I seem to recall that it was originally built for use as a military field tactical antenna. It does not radiate as well as a plain old ordinary dipole -- 10db or so relative loss seems to stick in my mind. What you give up in signal strength you gain in near flat SWR across across a wide spectrum.

On the other hand, since you're not on a battlefield looking out for incoming, you might have the few seconds needed to tweak a couple of knobs on a tuner ..... and put out a stronger signal to boot.

There a few minor differences. I believe there is only one Rx light, unlike
the Z1A which has one for each band. It was probably eliminated because it
is a smaller radio. Also, the Rx LED was located to the mic area. The W31A
is almost exactly like the Z1A except for the size, LED and non-detachable
face plate.

Had mine for several months now...heres my $0.02:

.. Biggest problem, imho, is no seperate volume control. Have to press a function button located above the PTT, then use the dials or up/down buttons. Very very bothersome when ragchewing a group with someone with a hot mike, another with low audio, etc.

.. The wallcharger needs to be plugged into the radio to charge the battery, there is no jack on the batterys for stand-alone charging. Wish I could use my spare nicad @ charge the dead nicad, but no..

.. Has much better ears than a voice. I have no problem picking up repeaters full scale, but sometimes get choppy signal reports on xmit. Using larger nicad (or external) to put out 5W solves this.

..The removable mic panel is a little hot, usually hold it about 6-8" away from the choppers. Consistently get good audio reports, but any background noise will be picked up by the mic. I've tried plugging in both MFJ and Realistic speaker mics, and get better audio reports from the removable panel speaker/mic.

..Programing is easy, but performing simple tasks can often be cumbersome. ie..to check the tone on a repeater pair u have in memory requires transfering the memory contents to vfo, switching to vfo mode, hitting 2 more buttons to display the tone, hitting another to clear the display, switch back to memory mode, then dial back the memory pair you were on!!! Too many buttons to hit when someone asks the tone on another repeater!

..audio output is low, with poor quality compared to other HTs I've used, imho. When monitering 2 frequencies, a noticeable 'hissing' noise can be heard, not present when monitering only one side. A nice feature however is the ability to direct one bands audio to an external speaker, the other sub-band to the speaker/mic panel.

..Intermod rejection is superb..at least compared to a Yaesu 5100, Yaesu FT416, and Radio Shack 202. Never even opened the squelch when the other radios were useless down in 'intermod alley'.

..Third party nicad vendors do not carry anything for this radio, several have told me in about a year or so. Icom wants over $120 for their hi-power nicad that will give you 5W! And another $140 or so for a fast desktop charger! The larger 9.6V nicad is only 650 mAh, I've found it only lasts about half the time the stock nicad will.

..The lighted display is very bright, with a nice option to turn the keypad lites off to conserve those nicads.

..The battery voltage can be displayed by hitting a few buttons, but there isn't any indicator that pops up for a low battery condition...the radio just shuts down.

..DTMF dialing for autopatches is easily performed with a one button keystroke to dial out any of your DTMF memories. Just make sure its set to the right one :-) The PTT automatically remains active while the DTMF memory is being transmitted, a nice little feature.

..The radio will receive everything from 50.00 through 999.900, with auto AM aircraft. Out of band xmit can be modifyed by removing a surface mount diode, have not seen this mod, only heard aboout it.

All the above may sound rather negative. but I rather tell you the cons, you can read the great gee-whiz pros in the glossy advertisments! Bottom line is I'm happy with it, works for me.

The following would only aaply to a cordless phone used in the U.S. I
don't know where you are...

900 MHz, cordless phones operate under provisions of part 15. Under these
rules you cannot replace the original antenna system with any other antenna
that will make the units performance change. You will notice that
manufacturers do not use common connectors such as BNCs on the equipment.
This is also required by the rules. The intent is so users cannot modify
the antenna system other than replacing a broken antenna with one approved
by the manufacturer. Adding an external amp would also violate part 15.
by being both an antenna modifications and likely exceeding emmision /
field strength limits (for 902-928MHz the limit is 500uV at 3 meters).

If you are intending to turn your phone into a ham station via modification
you then must be licensed, of course. And would be subject to part 97
concerning control operators, identification, permissable communications,
encryption/coding/cyphering, etc.

4337. Alinco HT with birds - help!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: fishern3485@cobra.uni.edu
Message-ID: <1995May24.162828.43722@cobra.uni.edu>
Source record: 217231

(cross-posted from rec.radio.swap)

I just bought a used Alinco DJ-500T, and have noticed it has a bit of
a fluke in the audio.

This is my first HT, so I don't know - maybe this is not that uncommon,
but in the first 30 minutes it's on, a buzz floats around the freqs on
VHF, lingering for around 30 seconds on each frequency. I have found that
shifting the battery (the 3v lithium that is laying on top of the keypad's
CPU chip) or pressing certain buttons/switches changes or moves the tone,
so I assume it is interferance generated by the chip. This tone is not
particularly bothering in itself, but while it does not register on the
s-meter, it DOES hold the squeltch open to about 80% of its range. (although
the squeltch does not seem to be able to kill much above "one bar" on
the meter)

Is this "normal" for older HTs to do, or is there a "fix"? I note that
the unit appears to have been expanded; the blue wire is clipped and
the unit appears to have been expanded; the blue wire is clipped and
taped, and also there is no laminated shield between the two halves
of the unit. (not sure if there should be one or not) I adjusted the
battery to fit snug on top of the chip, and clipped the blue wire's ends
very short, and this has calmed down the tones a tad bit, but there's
still lots of room for improvement.

The humm is not being generated by nearby electrical equipment, and the
fact that it does not show up on the s-meter tends to indicate an
IF stage is being picked up or interfered with. (55 mhz and 455 khz are
the only IFs listed in the manual)

Any help is greatly appreciated!

Well it could be either the tunner or the antenna. The most probable problem is that a capicator is arcing over in the tunner. How it could be an arc in the ffeline/antenna but most likely your tunner would cover some of this up. A less likely source of thisproblem could be a core in an inducter saturating. A 20 foot dipole on 40 metersa is going to have a very high VSWR and generate large voltage potentials. And once a capicator arcs in most of the late generation tunners it wioll keep arcing easier. You may need to use stubs or another means to get your VSWR down or get a better quality tunner.

After your series of postings a few months ago, I thought you'd
washed your hands of amateur radio, Kevin.
Unfortunately for Steven Gordon, neither the Maxon/Shit Shack
HTX202 or the Yaesu FT2500M are dual band mobiles. Given that the C5718DA
is what he's considering buying, that's probably what he's interested in,
not a 2m HT or a 2m mobile.
I've had some experience with Standard, Kenwood and Yaesu, and in
my experience, the Standards are clearly superior in every phase, not
simply intermod rejection. (Although the FT2500 may be more rugged, but not
much...) The Standard ads I've seen claim "superior" or "unparalleled"
intermod rejection, not superb. A Motorola Saber has superb intermod
rejection, a Yaesu FT530 does not. I would bet my C568A has better intermod
rejection to ANY dual band HT with wide band receive on the market.
Logically, if this is the case, then the Standard's intermod rejection is
superior or unparalleled. My experience in Milwaukee and Chicago has
indicated that this is true. Also, the C1208DA is not the 2m version of the
C5718DA, they are completely different radios, based on different
platforms. Your experience with one has little to do with the other. The
fact is, Standards have better receivers than most other amateur radios,
hence the claim they make in their ads.
My advice to Steven is to buy the C5718DA, I'm sure he'd be happy
with it. I've been more pleased with the Standards I've owned than any

Kenwood or Yaesu. That's my actual experience.

In Seattle there is one store. It is Anateur Radio Supply near Boeing field in south Seattle. They advertise in the ham mags. You can get their address and phone number there. If you have trouble finding it drop me another note and I will get it for you.

They are a great place. Fair prices, good stock, good people.

Would you like this graffitti problem in your neighborhood? The inner cities look like Hell, because no one cares. These commercial cd-rom folks will stop advertizing in our Amateur Radio Magazines and post here for Free. Do you want all the nuts and bolts magazine ads in our news groups? Hunderds of those little ads every week over and over. Then no more ham magazines...

Many good points, Bob. But i can skip over those, and i can often tell in advance of seeing by the large number of likely-to-be flaming replies attached to it. <GRIN> I can go to their WWW site if i choose to, and who knows; they might even do something cliever like include some useful things there which could encourage one to order the whole thing. What has me much more worred is junk e-mail, things that appear, unsolicited, in our e-mail (which many of us have to pay for) from these kinds of operations, simply because we posted here. Getting alot more of those really is going to be a problem.

Almost as bad as the SALE@ALLUS on amateur packet. Does anyone really read all that junk? Oh Sure! go eat a cookie.

<MUNCH> Yeah, and it won't be quite so bad if there was enough bandwidth to support it, and clever news readers. But if you get someone who hasn't connected to their packet BBS in a week or so, and merely goes to list the summary lines of everything they haven't read since then, that alone can practically saturate the pathetic 1200 bps channels that most people use in the S.F. Bay Area. It's both a bandwidth problem nationally, and in many cases locally, aggravated by junk-box human interfaces. <SIGH> [Sorry, folks, i guess i've just had a hard day]

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

4350. RFI Interference on Yaesu FT-11R

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: thendy@huachuca-sec1.army.mil
Message-ID: <2FC21A78@huachuca-sec3.army.mil>
Source record: 217339

I would appreciate any suggestions for eliminating RF interference on
my Yaesu FT-11R when I use it as a mobile.
I have the unit connected to a Larsen magnetic mount 1/4 wave Q series
antenna, with RG-58, mounted in the center of the roof of my '89 Nissan 4WD
Pickup.
The interference is a high level of background popping static on each
station. The interference happens whether I use the truck's power supply or
the radio's battery but only when the truck is running. Because of this I
think it's caused by RFI as opposed to power supply fluctuations.
To help alleviate the problem I took an ARRL recommendation and
connected all the major components of the vehicle to each other and ground.
This did not help. I did notice that when I connected the radio to my
base antenna, about 15 feet away, I did not have any interference.
I'm sure this is not a new topic for discussion, but I'm new to HAM and
would appreciate any advice on how to locate and minimize the source of the
interference.
Thanks in advance,

Ted Hendy

Sounds like you might have a breakdown (electrical) or short somewhere.
Check for bad connections. SWR can vary with power levels depending
on your meter and surrounding structures. I'd first check your
tuner then check the coax and antenna connections. You might want
to borrow an SWR meter and put it after the tuner and try your
test. Don't worry about the external SWR reading but watch it as
you increase power. If it changes (drastically) then put the SWR
meter at the antenna and do the same thing. If there is no change
then check your tuner.

Kevin

The dipole should be at least full half-wave on the lowest band you
want to operate on. For 40m that would be about 66 feet. You could
try feeding the dipole a a longwire to the tuner.

You would then use the tuner if you wanted to work less than 40m using
the same antenna.

From: gabe@panix.com (Gabe Wiener)
Subject: Motorola SP-10 walkie-talkies

For my point-to-point communication needs for security/trade-show
purposes, people have been recommending Motorola SP-10 UHF radios.
Can anyone tell me what the difference is between the P-10 and the
SP-10? And are there any mail-order dealers that offer these at
good prices?

Further, I hear a lot of talk about "GMRS" in references to these
radios. What does the acronym stand for? Thanks.

: Gabe,

: Radio Shack *DOES* sell GMRS radios (151/451 MHz) radios, and they are
: GREAT for use because they have a server mile range on them. They are
: $130 each I think, not exactly sure, but ask them for a "GMRS" radio on
: the "Blue-Dot", "Red-Dot" or "Yellow Star" frequency; the "Green-Dot"
: is 151.6250 MHz and is a well known frequency, so you should steer away
: from Green-Dot radios.

Whoa there.... GMRS is a UHF service, 462 MHz, and is NOT for commercial use anymore. This is NOT a GMRS application, although Radio Shack does

sell a GMRS radio. They do sell a business band radio on 151.625 MHZ, and
you can find Motorola P10s (and SP10s) fairly cheaply from a large number
of mail order stores on 154.57 and 154.6. All these must be licensed!
Check with a local commercial radio store, they may be able to help and
get something cheaply.

Regards,

S T R A W B E R R Y M A N T R A R E C O R D S

To get zines distributed, Email us at the Email address below with a
sample article and a description of the zine, or maybe even the whole
zine,
so we can make sure we want to distribute it, and if we say kuul, then
send
us some copies of the zine and yr in the catalog.
To get yr tapes distributed-Be good, and have nice sound quality. Send
a
good-sounding master tape and a master cover we can make black and white
copies from to the address at the bottom. If you don't send a master
cover,
we'll just make one. Don't expect great artwork. John's taking drawing
class.
We'll see what he can do. At least send a song list. The more you rock,
the
better. No Extreme-Hole Hearted Mr. Big shlock rock, please. We don't want
Country or Offspring or Contemporary or R & B or Reggae or Rap tapes. So
don't send them to us. If we don't like them, we put them away. Have any
or
all (?) of the following elements in yr music: rock, catchy rock, punk,
or
hardcore. Don't be lame, and, like we said, have nice sound quality.

Our royalty policy is real simple: When we distribute you, for each copy
of the album you sell through us, (whether it's on vinyl or tape or cd) you
get a dollar. Our royalty policy on zines is simple, too. You keep 70% of the
money, we keep 30% of the money. If we (as in you and us) decide yr zine will
be two dollars, we keep 60 cents for each sold zine. (60 cents just about
covers postage costs. the zine department is really non-profit) The remaining
$1.40 is yours! Because of this policy, we don't buy wholesale copies of
zines in advance. mainly cos it's risky to us and yr zine gets more money
this way.

*Online Zines: Don't wanna wait for snail mail to bring the zine to you?
Kuul! We'll Email it to you. Just send the money to the label address telling
what zine you want and where we Email the zine to so you can download it-and
the zine will be yours within seconds of receiving the money via a download
file. Available when the catalog specifies "Online Version." Some zines are
available Online only, some only by mail, some both. The royalty policies for
Online Zines remain the same. (yes, postage costs don't exist when you send
online zines, but really, it's not fair to the non-online zines. Some of
those zines have pictures and stuff, especially art/comic-type zines, which
would be way impossible to do online. They don't have the advantage of not
paying for copying costs and postage. Just cos they have pix doesn't mean
they should lose money.)

SoundClips from Strawberry Mantra Records. Download 20-45 second long
samples as Wave Files from Strawberry Mantra releases.

Email the screen name below to request a SoundClip. I M P O R T A N T!!!-Must
have a sound card to play these things. If you need help, after getting yr
clip, email me, i'll do what i can. Realize that mucho sound quality has to
be sacrificed to make SoundClips possible, and that SoundClips do not at ALL
represent the sound quality of Strawberry Mantra releases. If AOL said
"Welcome" when you signed on, then you probably, (unless yr sound runs
through that internal PC speaker that the modem noise comes through) can play
these things.

All prices include tax and shipping and handling.

If you run a little label yrself, contact us. We'll trade tapes and stuff.
We make sure the sound quality is nice on our releases. And, to smaller bands, four-track recordings are just fine. There's a lot you can do with four track recordings to make them sound really nice. We focus on the music.
That's why we give the bands the extra money, to bring out new material. It's
really money out of our pockets. But we're nice. We just want to make sure we
don't make ourselves look bad by releasing poor-quality recordings. That's all we ask. So talk to us! See ya later.
From John Mulhausen and Andrew Bales-Owners

Email SbryMantra@aol.com
Send zines, tapes and orders (cheks payable to John Mulhausen) to:
Strawberry Mantra Records
P.O. Box 701805
Tulsa, OK 74170-1805

COMING SOON
about 20 new albums are scheduled to be sent to us
The Video- a VHS tape w/ atticus finch, john, and others live. sketches, and
behind the scenes looks at kitty vamp and strawberry mantra records. probably
will cost 7 bux
Psychedelicatessen- Strawberry Mantra is putting together a compilation that
will be sent to 14 eager radio stations. (scary) and will include at least one
song from every band we distribute. (cept the ones on the kitty vamp compilation, of course) and if yr on the label yr on the comp. and it's going
to 12 radio stations who happen to be rather interested in us. scary....
zines galore. zines zines zines
tell me right now if you want to be updated. we're gonna bring out good stuff, but give us a second, the label is as of now, about 2 weeks old.

Subject: Psion 3a and packet

OK... here's a wierd one. I'm thinking about trying to setup a mobile packet rig. I've got a 2 meter HT and a Psion 3a (which is a palmtop, for anyone interested...). Has anyone ever tried to connect these two together? What kind of TNC would I need to buy/build? Has anyone ever tried this? I have heard of some people doing this kind of thing with a laptop, but never with a palmtop.

Ideas anyone?

From: thendy@huachuca-sec1.army.mil (Hendy, Theodore)
Subject: RFI Interference on Yaesu FT-11R

I would appreciate any suggestions for eliminating RF interference on
my Yaesu FT-11R when I use it as a mobile.
I have the unit connected to a Larsen magnetic mount 1/4 wave Q series
antenna, with RG-58, mounted in the center of the roof of my '89 Nissan 4WD
Pickup.
The interference is a high level of background popping static on each
station. The interference happens whether I use the truck's power supply or
the radio's battery but only when the truck is running. Because of this I
think it's caused by RFI as opposed to power supply fluctuations.
To help alleviate the problem I took an ARRL recommendation and
connected all the major components of the vehicle to each other and ground.
This did not help. I did notice that when I connected the radio to my
base antenna, about 15 feet away, I did not have any interference.
I'm sure this is not a new topic for discussion, but I'm new to HAM and
would appreciate any advice on how to locate and minimize the source of the
interference.
Thanks in advance,

Ted Hendy

>.............
> Is this feasible or does it even make sense ???

Charles-

About the only thing that makes "sense" about it, is that you can try it,
and it will probably work to some extent. That extent may be only a VERY
short distance. But, do you have any alternatives?

I don't like the slinky idea, because of losses due to resistance. One slightly better alternative exists, if you can find space for a 15 foot dipole. You could take two mobile antennas like the Hustler or Hamstick, and mount them as a dipole. The company that makes the Hamstick, also sells a bracket made for mounting two as a dipole, with a U-bolt for attachment to a mast. The U-bolt holes could be used to nail the bracket to a wooden rafter, or for suspending the assembly with heavy string.

Taking a similar approach to your slinky, you might use 4 Hamsticks, mounted as a vertical radiator and 3 radials. However, I don't think this will work much better than using a single Hamstick radial. In other words, you could mount the dipole in a 90 degree configuration with one element vertical and one horizontal. As you mentioned, an antenna tuner should handle minor variations from 50 ohms at the feedpoint.

Take care that the end of your radials are insulated from their surroundings. Even though they are simulating a ground, they will have similar (total) voltages and currents as the vertical element.

Most newer HF rigs have built-in computing VSWR meters and optional speech synthesisers. May I suggest that you contact the main manufacturers. I think you have a feature that they could probably implement quite easily in their next designs. It may not help you now, but it must be worth suggesting..

Hi,
Does he need a call to post here? Didn't know you needed a license for
usenet :-)

I picked up what appears to be a TWT in this class on Saturday at a swap meet.
It's got a WR90 output flange so it appears to be at least close to 10Ghz.
It came cheap: $10, but w/o a power supply. So I'm looking for data sheets
or even a complete supply for this. It is a Teledyne TWT. Well, if it's not
usable as is, it is at least worth $10 for the SMA connectors and other
hardware!

A spectrum analyzer would be a great find!

I bought a 10.5-11.5 Ghz circulator for $4 a few weeks ago. You can nudge these
slightly, I'm told.

Subject: WTB: ? Custom earpiece

Hi,

As an active ham and member of Amateur Radio emergency Services, I work a lot of public service events, severe weather watches and emergency events. To make using an HT during these events, which can last all day, a little easier, I'd like to have a custom earphone made. This would be the type that is used by television reporters that are molded to the wearer's ear and have a coiled cord running down to the HT.

If you know of any companies that do this sort of custom molding, please post a reply here or send mail. I'd appreciate any referalls that can be offered.

4356. Yaesu FT-11R/FT-41R/FT-51R to PC Kit

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-24 00:00:00 UTC
From: "Michael J. Freeman" <afn10044@freenet.ufl.edu>
Message-ID: <Pine.A32.3.91.950524021229.63378A-100000@freenet2.freenet.ufl.edu>
Source record: 217345

The folks who sell the kit which allows you to program a Yaesu FT-11R, FT-41R or FT-51R from an IBM-compatible PC running Windows are:

RT Systems
8207 Stephanie Drive
Huntsville, AL 35802

1-800-723-6922
1-205-882-9292

The programming kit costs $39.95 and includes either a 3.5" or 5.25" HD diskette of software and an interface cable to connect a serial 25-pin RS-232C port on your PC to the speaker jack on your radio.

The software consists of an installation program, an FT-11R programmer and an FT-51R programmer. (Although not documented, I've been told that the FT-11R programmer can also be used to program the FT-41R -- if you know how.)

The copy that I bought at the BirmingHAMfest (Birmingham, AL) last weekend states that it is an early, initial (beta) release and contained a registration card to be mailed to RT Systems to obtain the final release of the software.

I've used the interface cable and FT-51R programmer to save the memories and operational settings of both my wife's FT-51R and my own FT-51R, to edit the saved memories of my FT-51R, and to reload my FT-51R with this modified data. Although I encountered some very minor bugs, everything that I attempted seemed to go fairly well.

The biggest problem that I encountered was that the instructions for downloading the memory and operational settings of a radio were incorrect. However, it didn't take me long to determine how to make this procedure work correctly. (With the current release of the software, the trick is to remember to put your radio into clone standby mode before invoking the routine to read data from the radio. Then, after invoking this routine, remembering to put the radio into upload mode without being prompted.)

One of the nicest features of the kit is that it's possible to test the supplied interface cable, COM port and COM port settings with a standard terminal program, such as the one supplied with Windows. You don't have to depend on the programming software itself to determine that you've got a problem somewhere in your hardware setup, but can get all of this correctly configured before invoking the programming software.

All in all, even though the programming software is a beta release, I'm very pleased with the package and the results I obtained through its

use. Now if I can only find a use for the stereo cloning cable that my wife and I bought and used to copy memories between our radios before this kit was available!

I'm looking for a watt/SWR meter that will cover all the way from 160 meters to two meters. I've seen a few low power models advertized in some of the magazines. Would appreciate any info on various brands, their spec, etc.

73, Jay K0GU jayk@fc.hp.com

> Our club just bought an old Dentron MLA 2500. We paid about 500 $$.
>I am now worried since the finals cost 450 to 475 each.

I can't think of a poorer amp to use for a club. The 8873-4-5 family of tubes have very low grid dissipation ratings. Most MLA 2500's had no grid trip circuitry.

I would certainly install an electronic grid current sensing disconnect circuit in that amp. A fuse or resistor won't do at all, it has to be something reliable and fast. Fuses and resistors WILL NOT protect the grid adequately.

With a variety of operators, you are almost certain to lose the tubes post haste without using a well designed electronic grid protection.

From: bh489@freenet.buffalo.edu
Message-ID: <D9563C.JC4@freenet.buffalo.edu>
Source record: 217151

I just acquired a National HRO-600 and would like any information about it. Like when it was made, where it was sold (I can't seem to find any ads for it) How many were sold (the serial # is 156) Also, is the first receiver to use digital readout (nixie Tubes)

How many of these are around? This is the first one I've seen

Any help would be greatly appreciated, I have a HRO-500 and it is one of the best performing sets I've used!

Thank You For Your Time

Have a good day

Brian,

The FT-51R is a great radio! A third aprty vendor, RT Systems,
now offers a extremely nice windows program and interface cable
for the FT-51, FT-11. It allows you to save, restore, and edit
all the information in the radio. The price - $39US !!

The down side is that there is NO software documantation supplied
by Yaesu to allow someone to write thier own applications. the
people at RT Systems hacked the data format!

RT Systems - 205.882.9292

Have fun,
Tom KA3GYI.

>> Am considering buying the Standard C5718DA dual band mobile. I hear
>it
>> has great intermod rejection...

This appears to be the latest trend in advertising. Say it has
"superb intermod rejection" when in fact, the claim is totally
baseless. Standard claims this for virtually every radio they make!
Have you seen their ads over the past year?

Great intermod rejection where? I had the 2-meter version (C1208DA)
of the above rig. It DID have intermod problems. In the 2-meter
band it was "acceptable". On UHF (receive only) it was often useless
due to extreme intermod. Overall, it was a good (not great) radio.
I guess that's their refinition of "superb".

If you want "superb intermod rejection", buy a Radio Shack HTX202 HT
or the Yaesu FT2500M mobile.

Can anyone comment (based on actual experience) on the rest of the
Standard line? Thanks.

Subject: Icom IC-W31A Modifications

I"m the shiny new owner of an IC-W31A handheld transceiver. My mentors
in the world of amateur radio tell me that there are "soft"
modifications which can be made to a unit simply be exercising
unpublished keystroke sequences. I am interested particularly in
extending the receive range to include the aviation band from 118.00 and
up. Does anybody have any insight into the potential for such mods for
the unit?

Thanks in advance,

Walt Johnson N3385L

>
>>Does anyone have any comments on the new Icom Z1A dual band ht?
>If you don't want the detachable panel, Icom
>makes a model without it...

I echo all of Jonathon's comments...I've gotten IC-W31A without the detachable panel (by choice) and paid $419 (from KLI) at the Owego hamfest. I love the humanfactors interface that it has, very user friendly for this new ham. The standard battery is 4.8 volt, which gives about two watts o/p, so I bought the cigarette lighter adapter for my use from the plane, car, and boat. The 13.5 volt battery is $120! I also added an ALR 800 "hot rod" antenna package to help me "hit" the repeaters from remote locations. I've installed an airframe mounted permanent antenna for bird to get the signal outside of all the aluminum. This will probably require a low power setting to avoid hitting EVERY repeater on the frequency!

The rational for my purchase of the IC-W31A was:

1) My ham "mentor" has an IC-W21AT and she loves it! So does her husband!
2) The keypad is lighted for night use...its bright enough to help you read the repeater book and find the frequency you need in an emergency!
3) ICOM has an excellent reputation in the aviation handheld market. The marine people seem to think well of the ICOM line as well.

Subject: copper pipe j-pole

Well, I'd pay a reasonable price for a copper cactus j-pole if it were nicely made. I would think that 20 or 30 dollars would not be too much. Many of us either do not have the tools and-or time to fool with it. I know, it doesn't take a lot of tools but if you do not already have them then you'll spend a lot of money for something you might use one time. Go for it. I think they will sell like hotcakes.

From: bblohm@boi.hp.com (Bill Blohm)
Subject: Yaesu FT-2500M Any info please.

Followup to my previous post in here:

All in all, I like the FT-2500M. It's solid, the manual is good, and in
general, with my limited use so far I like it. The only thing I miss
or haven't figured out how to do yet, is directly dial in the freq
I want. I can get close by hitting the MHz switch, using the up/down or
the tuning dial to quickly switch to the MHz setting, hit the MHz to get the
KHz part back and then tune up or down to the desired setting. However,
I would really like to be able to just key in on the DTMF pad, for example,
6520 and have it go to 146.520 MHz. That's the only thing so far. I also
like being able to use 4 chars to ID my settings in memory rather than
having to remember which is the private repeater so I don't use it. The
limit of only 4 chars is understandable, I guess, though I would have
thought 5 would be the limit (14 6 .5 2 0 in the example above). Makes
for some interesting labels, for example if I get stopped by the cops, I
better hope he doesn't think I'm a drug dealer, I've got SNOW for Snowbank
Mountain.

Now to make the packet connection to the mic connector. At least we have
the tools here at work if I can find a shielded cable to work....

The Yaesu FT-2500M has the clone facility that lets you copy
the settings to another FT-2500M. Wonder if that means it
can also be used for controlling it?

I bet you would feel a lot better if you new that your nieghbor
knew the basics of RF energy, as he was bouncing 10 watts of
10 GHZ energy of your house walls and backyard. The basic request
led me to believe that he may not have any experience with this
equipment and could pose a health hazard to himself and others.

Callsign request would have allowed me to know his QTH and would
have been able to recomend an experienced user in this band. I am
all for new blood in Ham Radio and always encourage newbies.

Have a nice day VE7AHL

4364. Motorolla MT-1000 freq range?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-25 00:00:00 UTC
From: las5s@kelvin.seas.Virginia.EDU
Message-ID: <D9510G.nv@murdoch.acc.Virginia.EDU>
Source record: 217154

Hey ya-

I was wondering if anyone knew the freq range for the
Motorolla MT-1000's. I was told that they can't go up to 160
MHz... and I was also told that they can go up to 173 MHz. I
would be thankful to any reply to my e-mail: lauren@virginia.edu

Thanks,

Lauren

Well, I can see my message from yesterday sure got screwed up! What I was trying to say is that I have a Standard C168A 2-m HT. It has no intermod problems with an antenna as good as an AEA HotRod; but when I hook it up to an external antenna such as a roof mounted 1/4 wave ground plane, or a trunk mounted mobile antenna, intermod is terrible! However, as I said once before, the intermod is eliminated when I hook up the HT to a Radio Shack 2m amp.

'lo
What handy do you think is the best one to buy today?
I'm going to buy a new handy... but I'm not really sure
'bout what would be the best one.
I've heard that FT-11 and FT-26 are worse than TH-22...
and TH-22 is less than TH-28... etc.
So I want to know what do you think about it.
I've worked with TH-28 and TH-22 but I've never used a new
Icom or Yaesu so if you could post some references would be
greatly apreciated.
Thanks in advance...

Rod.

On 40 meters the two more popular frequencies are 7.195 Mhz (Ragchews)
and 7.213 (Mobile to Mobile).

Hope this helps.

4371. Smoke Escaped from FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-25 00:00:00 UTC
From: Scott_Rider@CCM.jf.intel.com
Message-ID: <X4950525165550@srider>
Source record: 217161

While examining my "high serial number" FT-530 UHF board,
I reassembled it and accidently contacted the hot lead from
the aux power input (next to the ant. BNC connector) to
a part of the case that is tapped for a screw.

When I reattached the battery, some smoke escaped. I am now
repairing damage to the flex cable that brings power from
the plug to the connector at the bottom of the UHF and VHF
"mother" boards.

So, CAUTION, when reassembling FT-530 UHF board, make sure it
is pulled "down" away from the BNC and power connector so you,
too, don't let out some of the smoke.

BTW, I still cannot find the "missing" components after a
serious schematic tracing session and side by side comparison
with an early unit that receives the 800-900 public service and
ham range. Guess it's signal tracers and o-so-silly-scopes
from here unless someone out there knows anything.

Lauren,

There are a few differnet splits the the MT-1000 as follows for VHF

136-151
146-162
157-174

The newer HT-1000 are wide band.. 136-178. You can move the MT-1000
range around alittle, but not alot.

4374. Mod to allow IC-38A xmt 219MHz?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-25 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goD93yDw.1yJ@netcom.com>
Source record: 217164

The Icom IC-38A covers 215-230 MHz on receive and 220-225 MHz on transmit. For initial path tests in the new point-to-point fixed digital message forwarding system 219-220 MHz band, it would be useful to be able to transmit using an IC-38A between 219 and 220 MHz.

Neither ICOM America or ARTSI, publisher of Radio/Tech Modifications, has any information on such a modification.

Any information which could be used to disable the transmit inhibit to allow transmission between 219 and 220 MHz would be most appreciated. Perhaps someone in Japan who reads this message has a friend who knows the firmware in the IC-38A? My guess is that a diode matrix must be changed (a diode snipped or a diode installed) and then the micro-processor must be reset, but I'm not going to experiment!

>I have a TS-820 with a T-1000 antenna tuner, and a roughly 20 foot dipole
>antenna. I've had some trouble trying to use this on 40m.

A few questions first -

1. Are you using coax or ladder line to feed the dipole?

2. If ladder line, are you using an external balun or does the T-1000 have one built-in? (I'm not familiar w/ this particular tuner.)

3. Again, if ladder line, is any part of the line touching any non-insulated objects or structures?

4. If coax, are you using a balun at the center of the dipole?

5. How is the dipole supported? Are the center and end insulators a commercial product? If not, what material are they made of?

6. Are the legs of the dipole constructed of insulated or bare wire? Is any part of it touching a painted surface (such as part of your house or other structure)? Is any part of it in contact with foliage such as tree limbs, leaves etc.?

The answers to these questions will hopefully provide a few clues that will help to track down the problem.

I would like to add the most common cause of this kind of SWR fluctuation
that I have seen in the mobile which is corona at a sharp point on the
antenna at a voltage maximum.
Maybe this is possible at the ends of a fixed dipole as well...under
certain conditions...at the ends, etc.

From: lager@primenet.com
Message-ID: <3q5m5t$7is@news4.primenet.com>
Source record: 217098

Hi all. Just picked up a couple of IC-24ET sets and need some help. I do not yet have a manual for these radios and have some questions. First, the fellow I got them from says that they have had a diode installed to expand their coverage. I do not know which diode though so I think I will just have to rely on the display to give me information. Is it true that I should be able to receive any frequency that I can dial up? The frequencies that I can display are as follows:

.00 to 354.97
and
355.00 to 1310.00

Does this mean I have complete coverage from 0 to 1.3Gig? I am a total radio rookie so please be kind. Thanks.

According to "the bible", Fred Osterman's "Shortwave Receivers Past and
Present", the HRO-500 was manufactured around 1964. I *do* recall
seeing announcements for it in electronics and amateur radio magazines
of the era, but no advertisements. I think the U.S. government bought
most of them -- that seems to be the source most that have recently
hit the market.

: the Yaesu FT-51R dual-band HT? I got the details from Yaesu but what's
: not clear to me is how it works.

I got it figured out. After the modification the bottom part of the PTT button, when pressed alone (i.e., not with the PTT), keys the radio and sends the 1750 Hz tone. Thanks also to Frank, DL8YDR for confirming it.

By the way, the mod. is very easy. Works like a charm!

I had this problem and solved it with an intermodulation filter from
Tucker Electronics. They have an 800 # and I think is it under $100.
Runs off your car's 12 V DC. Another Co. makes one too, I forget the
name.

I can't address the GE, as I do not have hands-on experience with it,
but for the Motorola line, programming requires a RIB (radio interface
box), a radio-specific cable, and Motorola's software.

All together, these items will be in the $600-700 range. The RIB is
used for most of Motorola's line, but the cables and software are
specifc to each model.

There has been a string recently in one of the newsgroups regarding
Motorola software. Suffice it to say that it is copyright software,
and Motorola is quite active in its protection of those copyrights.

If you don't want to purchase the software and RIB, your best bet is to
make friends with a Motorola dealer, and have him do your programming.

4400. Looking for Drake TR-3 Information

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-26 00:00:00 UTC
From: Tom_Taylor@Taligent.com
Message-ID: <Tom_Taylor-2605952248010001@kip-2.taligent.com>
Source record: 217176

I bought an old Drake TR-3 from a ex-ham for $25. The radio
came with a homebrew power supply and an ElectroVoice microphone.
Unfortunately, like many used rig purchases, the radio didn't
come with a manual.

The TR-3 probably hasn't been used for at least ten years. The
chassis inside looks pretty dirty and dusty. Of course, the first
thing I did was plug it in and see if it worked :-)

It does work, at least receive, to some extent. I listened to
several VK stations on 20 meters. The audio has
a noticeable hum (remember that homebrew power supply)-:) and
is accompanied by loud pops and crackling noises, like that of
a dirty potentiometer (even when the volume control isn't moved).

Where should I start to get this radio back in operation? Is it a
radio worth putting back in operating order? Finding
a copy of the manual would probably be a good start. Any suggestions
of where to look or whom to ask?

I've read about a Drake HF net, but not owning any Drake gear at the
time, I quicky zipped by the message. Do you know the time and
frequency?

Thanks!

>I try to crank the power level up. At about 10 watts the SWR suddenly
>bounces to 5 and no amount of readjusting the antenna tuner will bring it
>down below 5.

>Is this a rig problem? A antenna problem? Or a antenna tuner problem?

>I'm new at this so not sure whats happening.

I have also had problems with SWR bridges at low power settings.
I once hooked a 30M QRP transmitter (2.5 watts) up to a home built
SWR meter and a 50 ohm load and measured no reflected power. No
problem. I then proceed to connect to 100 ohm and still measured 1:1
SWR! The design I used was one I found in some ARRL QRP manual that
provided a proper load to the transmiter, while using a small portion
of the RF applied across a 50 ohm wetstone bridge configuration, one
leg of which included the antenna.

The problem I had was that I was dealing with small voltages
rectified by a diode with a nominal 0.5 to 0.7v drop. The diode
drop ate most of my available voltage, which, was only about 1v
peak to begin with.

My problem was cured by connecting the RF bridge directly to the
output of the transmitter. At 2.5 watts into no load, this gave me
about 7 volts to work with across the detector. This increased the
mismatch the transmitter will see during tune up, but at least now

I get a much better picture of my true antenna situation.

You are probably dealing with a similiar situation.

From: "Michael J. Freeman" <afn10044@freenet.ufl.edu>
Subject: Yaesu FT-11R/FT-41R/FT-51R to PC Kit

The folks who sell the kit which allows you to program a Yaesu FT-11R,
FT-41R or FT-51R from an IBM-compatible PC running Windows are:

RT Systems
8207 Stephanie Drive
Huntsville, AL 35802

1-800-723-6922
1-205-882-9292

The programming kit costs $39.95 and includes either a 3.5" or 5.25" HD
diskette of software and an interface cable to connect a serial 25-pin
RS-232C port on your PC to the speaker jack on your radio.

The software consists of an installation program, an FT-11R programmer
and an FT-51R programmer. (Although not documented, I've been told that
the FT-11R programmer can also be used to program the FT-41R -- if you
know how.)

The copy that I bought at the BirmingHAMfest (Birmingham, AL) last weekend
states that it is an early, initial (beta) release and contained a
registration card to be mailed to RT Systems to obtain the final release
of the software.

I've used the interface cable and FT-51R programmer to save the memories and
operational settings of both my wife's FT-51R and my own FT-51R, to edit
the saved memories of my FT-51R, and to reload my FT-51R with this modified
data. Although I encountered some very minor bugs, everything that I
attempted seemed to go fairly well.

The biggest problem that I encountered was that the instructions for
downloading the memory and operational settings of a radio were incorrect.
However, it didn't take me long to determine how to make this procedure
work correctly. (With the current release of the software, the trick is
to remember to put your radio into clone standby mode before invoking the

routine to read data from the radio. Then, after invoking this routine, remembering to put the radio into upload mode without being prompted.)

One of the nicest features of the kit is that it's possible to test the supplied interface cable, COM port and COM port settings with a standard terminal program, such as the one supplied with Windows. You don't have to depend on the programming software itself to determine that you've got a problem somewhere in your hardware setup, but can get all of this correctly configured before invoking the programming software.

All in all, even though the programming software is a beta release, I'm very pleased with the package and the results I obtained through its use. Now if I can only find a use for the stereo cloning cable that my wife and I bought and used to copy memories between our radios before this kit was available!

Yaesu (and many others) have learned from Sony: make the power cord connection a non-standard size, so that you can rake people over the coals for accessories. :-(

The possible solutions are (1) buy the manufacturer plug (the ones that may be the same size for other manufacturers will likewise be marked up beyond all sense), (2) replace the internal jack with something standard, invalidating your warantee, or (3) buy a (preferably alkaline) battery pack and add a molex connector to allow external power in that way. Done properly, you can still load up the pack with AA's and run on them when you need to, and it hardly looks ugly at all :-)

Part of the 70cm band plan indicates a multimode use of the band around 432.10. My TM-733A will not allow me to operate in this portion of the amateur band. Does anyone know why?

The folks who sell the kit which allows you to program a Yaesu FT-11R,
FT-41R or FT-51R from an IBM-compatible PC running Windows are:

RT Systems
8207 Stephanie Drive
Huntsville, AL 35802

1-800-723-6922
1-205-882-9292

The programming kit costs $39.95 and includes either a 3.5" or 5.25" HD diskette of software and an interface cable to connect a serial 25-pin RS-232C port on your PC to the speaker jack on your radio.

I'm curious as to whether or not this is a similar setup to the Casio BOSS handheld computer. It uses the same kind of cable setup?

4407. INFO WANTED ON BENDIX-KING HTs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-26 00:00:00 UTC
From: cweddle@astro.as.arizona.edu
Message-ID: <3q4p11$o84@news.ccit.arizona.edu>
Source record: 217183

This is a request for information & opinions on the equipment listed.
It is not an offer to buy or sell anything.

I've come upon 2 Bendix-King HTs in a local junk shop. Knowing little
about their value or features, I'm looking for opinions. The radios are:
2 each Bendix-King Handie Talkies
2 each speaker mikes
2 each rechargeable battery (1 per radio)
1 drop in charger
Claimed band: 144.000mhz to 159.995mhz.
14 channels, supposedly keyboard programmable.
Numbers from the back panels:
NSN5820-01-274-5063
RT-1594/PRC-127
22373/062-0118-00
DAAB07-88-C-TO25/002867AA apparently a serial number
DAABO7-88-C-T025/11989AA sn on 2nd radio
The asking price is $500 for the lot.

What can people tell me about these? Are they really programmable? Output
power? Is the bandwidth stated accurate? They have rather a military look
to them, could they be mil-surplus? Batteries are dead and didn't have time
to wait for a charge - if they'll charge!! These would be very useful in
the volunteer Search & Rescue team I'm a member of. Where might I find
another charger? What would be a fair price? Of course user/service manuals
would be a big help!?

All advice appreciated,
Chris Weddle, N7RME
cweddle@as.arizona.edu

4414. Yeasu FT-11R computer interface

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-26 00:00:00 UTC
From: killian@aztec.asu.edu
Message-ID: <3q4pm8$qbu@news.asu.edu>
Source record: 217190

The Yeasu FT-11R (and the 41 and 51 as well) has a serial interface that is used for cloning of two units. Does anyone know what the protocol is for this interface (i.e. baud rate, voltage levels, data format, etc...). I would like to write a program to read the HT configuration into a PC, alter it there, and then download the data back to the HT.

There is a program out there that is available to do this, however it is over $40 and there is no documentation or demo available. I have a hard time shelling out that kind of cash on something that I can't know ahead of time how it will work. Also, a basic program like this would be pretty simple to write and I can store the data in a format that would be usefull to me.

Thanks.
Mike

From: ericbba@aol.com
Message-ID: <3q57nk$nvh@newsbf02.news.aol.com>
Source record: 217191

Greetings!

I have owned several Bendix/Kings, and the police dept I work for uses them as well. I have never seen one that does the Ham bands, in fact the lowest I have seen one go is about 150 Mhz
even. These radios I have used go up to about 176 179? somewhere in there. There are also UHF models available. Quite a few federal agencies have used them, such as the local Border Patrol, and National Parks Rangers at numerous parks. I haven't noticed if they still carry them or not. As to the issue of keyboard programming.... The older models are good to go LPH 5141 etc.
The newer ones are not as easily programmable, but I have heard that it is possible. On the older ones, you have to short two pins on the side connector to enable programing mode.

Most used ones that I have purchased, cost me no more than $300 each w/o accessories.

Hope this has been helpful...

From: smiller@intelsun.rus.uni-stuttgart.de
Message-ID: <3q49fg$1skr@info4.rus.uni-stuttgart.de>
Source record: 217195

Has anyone made the 1750-Hz tone burst mod. to the U.S. version of the Yaesu FT-51R dual-band HT? I got the details from Yaesu but what's not clear to me is how it works. Is the tone burst sent with every transmission? Or only when you're in duplex mode (separate TX/RX freq.)? Or do you have to press a button to send the burst?

I don't want to take apart the radio and get into it with a soldering iron if I'm just gonna have to undo it later. I want to run packet radio with it too, and here in Europe we have packet repeaters (duplex) that do NOT use 1750 Hz tone burst, of course.

Thanks for any tips!

From: fishern3485@cobra.uni.edu (Nathan Fisher)
Subject: Alinco HT with birds - help!

(cross-posted from rec.radio.swap)

I just bought a used Alinco DJ-500T, and have noticed it has a bit of
a fluke in the audio.

This is my first HT, so I don't know - maybe this is not that uncommon,
but in the first 30 minutes it's on, a buzz floats around the freqs on
VHF, lingering for around 30 seconds on each frequency. I have found that
shifting the battery (the 3v lithium that is laying on top of the keypad's
CPU chip) or pressing certain buttons/switches changes or moves the tone,
so I assume it is interferance generated by the chip. This tone is not
particularly bothering in itself, but while it does not register on the
s-meter, it DOES hold the squeltch open to about 80% of its range. (although
the squeltch does not seem to be able to kill much above "one bar" on
the meter)

Is this "normal" for older HTs to do, or is there a "fix"? I note that
the unit appears to have been expanded; the blue wire is clipped and
the unit appears to have been expanded; the blue wire is clipped and
taped, and also there is no laminated shield between the two halves
of the unit. (not sure if there should be one or not) I adjusted the
battery to fit snug on top of the chip, and clipped the blue wire's ends
very short, and this has calmed down the tones a tad bit, but there's
still lots of room for improvement.

The humm is not being generated by nearby electrical equipment, and the
fact that it does not show up on the s-meter tends to indicate an
IF stage is being picked up or interfered with. (55 mhz and 455 khz are
the only IFs listed in the manual)

Any help is greatly appreciated!

> > ke6knf

The classic 6 meter ssb/cw rigs are the Drake TR6 and the Heath SB-110. Each runs close to 200 watts input. The Drake is usually very hard to find because it is a real treasure to 6m enthusiasts. Heath SB-110s are more common and work just fine. I have put in years on six using a 9110 with very good luck.

Don9t think you9ll find much AM activity left on 6, though I rarely tuned up higher in the band where the AM guys hang out. The SSB/CW stuff is all down at the bottom edge.

From: kc7fqd@primenet.com (Dennis Rice)
Subject: intermod on dual band radios

Is intermod more common on dual band radios or just mine?

I was driving down the freeway the other day and there was a 1/2 mile portion where I received police(?) transmissions on ALL frequencies on my FT-530.

Is this common?

>I try to crank the power level up. At about 10 watts the SWR suddenly
>bounces to 5 and no amount of readjusting the antenna tuner will bring it
>down below 5.

>Is this a rig problem? A antenna problem? Or a antenna tuner problem?

>I'm new at this so not sure whats happening.

I have also had problems with SWR bridges at low power settings.
I once hooked a 30M QRP transmitter (2.5 watts) up to a home built
SWR meter and a 50 ohm load and measured no reflected power. No
problem. I then proceed to connect to 100 ohm and still measured 1:1
SWR! The design I used was one I found in some ARRL QRP manual that
provided a proper load to the transmiter, while using a small portion
of the RF applied across a 50 ohm wetstone bridge configuration, one
leg of which included the antenna.

The problem I had was that I was dealing with small voltages
rectified by a diode with a nominal 0.5 to 0.7v drop. The diode
drop ate most of my available voltage, which, was only about 1v
peak to begin with.

My problem was cured by connecting the RF bridge directly to the
output of the transmitter. At 2.5 watts into no load, this gave me
about 7 volts to work with across the detector. This increased the
mismatch the transmitter will see during tune up, but at least now
I get a much better picture of my true antenna situation.

You are probably dealing with a similiar situation.

From: "Michael J. Freeman" <afn10044@freenet.ufl.edu>
Subject: Yaesu FT-11R/FT-41R/FT-51R to PC Kit

The folks who sell the kit which allows you to program a Yaesu FT-11R,
FT-41R or FT-51R from an IBM-compatible PC running Windows are:

RT Systems
8207 Stephanie Drive
Huntsville, AL 35802

1-800-723-6922
1-205-882-9292

The programming kit costs $39.95 and includes either a 3.5" or 5.25" HD
diskette of software and an interface cable to connect a serial 25-pin
RS-232C port on your PC to the speaker jack on your radio.

The software consists of an installation program, an FT-11R programmer
and an FT-51R programmer. (Although not documented, I've been told that
the FT-11R programmer can also be used to program the FT-41R -- if you
know how.)

The copy that I bought at the BirmingHAMfest (Birmingham, AL) last weekend
states that it is an early, initial (beta) release and contained a
registration card to be mailed to RT Systems to obtain the final release
of the software.

I've used the interface cable and FT-51R programmer to save the memories and
operational settings of both my wife's FT-51R and my own FT-51R, to edit
the saved memories of my FT-51R, and to reload my FT-51R with this modified
data. Although I encountered some very minor bugs, everything that I
attempted seemed to go fairly well.

The biggest problem that I encountered was that the instructions for downloading the memory and operational settings of a radio were incorrect. However, it didn't take me long to determine how to make this procedure work correctly. (With the current release of the software, the trick is to remember to put your radio into clone standby mode before invoking the routine to read data from the radio. Then, after invoking this routine, remembering to put the radio into upload mode without being prompted.)

One of the nicest features of the kit is that it's possible to test the supplied interface cable, COM port and COM port settings with a standard terminal program, such as the one supplied with Windows. You don't have to depend on the programming software itself to determine that you've got a problem somewhere in your hardware setup, but can get all of this correctly configured before invoking the programming software.

All in all, even though the programming software is a beta release, I'm very pleased with the package and the results I obtained through its use. Now if I can only find a use for the stereo cloning cable that my wife and I bought and used to copy memories between our radios before this kit was available!

Yaesu (and many others) have learned from Sony: make the power cord connection a non-standard size, so that you can rake people over the coals for accessories. :-(

The possible solutions are (1) buy the manufacturer plug (the ones that may be the same size for other manufacturers will likewise be marked up beyond all sense), (2) replace the internal jack with something standard, invalidating your warantee, or (3) buy a (preferably alkaline) battery pack and add a molex connector to allow external power in that way.

Done properly, you can still load up the pack with AA's and run on them
when you need to, and it hardly looks ugly at all :-)

I can't address the GE, as I do not have hands-on experience with it,
but for the Motorola line, programming requires a RIB (radio interface
box), a radio-specific cable, and Motorola's software.

All together, these items will be in the $600-700 range. The RIB is
used for most of Motorola's line, but the cables and software are
specifc to each model.

There has been a string recently in one of the newsgroups regarding
Motorola software. Suffice it to say that it is copyright software,
and Motorola is quite active in its protection of those copyrights.

If you don't want to purchase the software and RIB, your best bet is to
make friends with a Motorola dealer, and have him do your programming.

Me-thinks your mag mount antenna is most of the problem. Attach the
antenna to the vehicle (drill a hole in the truck!!).

While you have your tools handy, find a way to ground the transceiver
chassis to the truck body with a -short as possible- piece of ground strap or
coax shield or other *large* cross section conductor. It should help your
situation. And the price is right.

Good luck. 73 de Jim K5IK

And you won't find any missing components is my opinion. The changes
are almost certainly in the programming. You can't do anything about
it so just forget it is a very likely scenario here. Thank your
government!

Well, I can see my message from yesterday sure got screwed up! What I was
trying to say is that I have a Standard C168A 2-m HT. It has no intermod
problems with an antenna as good as an AEA HotRod; but when I hook it
up to an external antenna such as a roof mounted 1/4 wave ground plane, or
a trunk mounted mobile antenna, intermod is terrible! However, as I said
once before, the intermod is eliminated when I hook up the HT to a Radio
Shack 2m amp.

Message-ID: <1995May27.171347.12447@ultb.isc.rit.edu>
Source record: 217111

I recently performed the wideband RX/TX mod on the 79A (discussed in v1.5 of the TH79A file on oak.oakland.edu). The diodes were small. I used a magnifier, a sharp soldering iron with a copper wire wraped around the tip to extend the tip to the end of the wire, and a dentist's pick. Was not too bad. Worked fine, and cleared my memory as expected. No noticable increase in intermod.

The clone function works, I cloned my TH79A (moded) from a TH79A(D). It takes about 5 mins. For the record: THE CLONE IS COMPATABLE BETWEEN UNITS. Cloning sends the 80+LIMITS+CALL memories. It sends the frequency, ID, and possibly PL tones. It does not send DTMF memories. It does not send the power on message tag.

Source record: 217115

Quick question:
What is usually considered the minimum amount of equipment needed to work the Shuttle? With STS-70 coming up here pretty soon, I am interested in seeing if I can work them. Would 30 watts into, say a 3 or 4 element quad do the job? (Those of you who read my "Quad or Quagi" post in r.r.a.a can see where I'm going)

Thanks and 73,
Russ KI7FL

> > Ted Hendy

Me-thinks your mag mount antenna is most of the problem. Attach the antenna to the vehicle (drill a hole in the truck!!).

While you have your tools handy, find a way to ground the transceiver chassis to the truck body with a -short as possible- piece of ground strap or coax shield or other *large* cross section conductor. It should help your situation. And the price is right.

Good luck. 73 de Jim K5IK

4441. Modifying the Azden PCS-4000

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-27 00:00:00 UTC
From: dave@eram.esi.com.au
Message-ID: <3q6lom$1il@eram.esi.com.au>
Source record: 217127

Modifying the Azden PCS-4000

The Azden PCS-4000, popular some years ago, is a 25W mobile FM transceiver. Functions such as frequency selection etc are performed by a matrix of buttons on the front panel (and auxiliary buttons on the microphone); there is no "VFO" control as such. The control microprocessor continually scans this matrix; this scanning also applies to the frequency display and other functions.

Many preset functions, such as band limits and step, are also under the control of the matrix, and these are readily modifiable by the user. NB: it is likely that other adjustments may have to be done if the band edges are changed.

Call the scan lines K0 - K3 and R0 - R6 (using Azden's nomenclature); refer to the circuit diagram for their location. Lines K0-K3 take part in most operations, R0-R3 scan the keyboard, R4 scans the "M-Mode" switch, R5 selects the step, and R6 the band edge. The following are under control of these lines:

[O - Open, S - Short (diode)]

STEP
R5
5K 10K 12.5K 15K 20K 25K 40K 50K

K3 O O O O S S S S

K2 O O S S O O S S

K1 O S O S O S O S

By default, the rig is shipped (in Australia anyway) with steps of 5 and 10 KHz; to change to 5 and 25 KHz it can be seen that all that is required is the addition of a diode at K3/R5. This can be done anywhere, but I installed mine on the small PCB holding the STEP switch behind the front panel; I prefer my mods to look as though they were original.

BAND (2m version only)

R6
US JP EU
US: 142.000 - 149.995, 5 kHz
K3 O O O
JP: 144.000 - 145.995, 5 kHz
K2 O O S
EU: 144.000 - 145.995, 12.5 kHz

K1 O S O

This is of limited use, unless you were contemplating modifying
an imported set, in which case a realignment is probably necessary.

Interesting. I don't have much problem with intermod, but I wonder about my RS 2M amp's preamp; there seems to be little attenuation of signals at 155 MHz and thereabouts. Anyone with this amp tried listening to such signals, or NOAA weather at 162.<mumble> MHz, and found any difference to speak of?

I would like to upgrade the clubs repeater by replacing the
existing 450 Mhz link recivers. We are currently using four
GE Mastr Execs which work great, but require a good bit of space.

The objective is to reduce space in the cabinet and
keep the cost as low as possible.

Has anyone had experience using the receivers from UHF handhelds ?

If so, what types have been used and what complications
(if any) have you run into ?

Any feedback would be greatly appreciated.

Thanks john k3nxu jlamar@yrkpa.kias.com

Well it's $40 and it works great. It also runs under windows and allows
every function to be set up via the P.C. I can now program the 51 with
alpha-numerics in 25 seconds instead of 1 1/2 hours. Why bother writing a
simple program when this is available and it also comes with the
programming cable for that price.

Source record: 217131

I have a W21E which lacks the keypad but otherwise the same. I did hear about a mod with some diode that allows continuous tx but it sounds messy and I don't know if I really want to transmit on police freqs. I would mind however to have the full 420-450 coverage since if I ever go to the US I won't be able to use my rig since I only have 430-440 tx and all your repeaters and contacts are between 440-450.

Mine has cont rx with reasonable sensitivity from around 75MHz to 945 MHz without any mod whatsoever.

Could you please forward me comments from others about this rig.

Regards,

Len

Source record: 217133

[Article crossposted from rec.radio.amateur.misc]
[Author was Greg Tupper]
[Posted on 28 May 1995 00:31:43 GMT]

I have an ICOM BP-24, and no longer have the wall charger for
it. The local electronics shop/ HAM shop did not have any
information on the battery pack and were unable to help me.
I would like to know the specs of the pack and the voltage to
apply to either or BOTH the ports on the pack.

A note on the back of the battery states "Charging this battery
with the CM-16 or BC-16 wall charger while attached to an operating
handheld...." So the specs for either of the two charging units
specified would probably help also.

Thanks

PRC-127 early models covered 144 - 160 Mhz. The Army paid abt $1000 each. A
number of commercial, local, and federal agencies use these and the stealth

models. They work well and are rugged. Once programmed, even a grunt can use one.

4462. synthesizer for Clegg FM-76?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-28 00:00:00 UTC
From: johnmxl@ix.netcom.com
Message-ID: <3q96qo$45p@ixnews4.ix.netcom.com>
Source record: 217138

Hi to All...

I recently purchased a Clegg FM-76 220 mhz transceiver. This is a late 70's vintage crystal-controlled mobile rig.

I have located several sources for crystals, but I would like to find out if anyone ever designed a external synthesizer for this unit.

I have searched thru my collection of old 73 magazines, but can't find anything.

Any help you can provide will be appreciated.

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works fine, but it needs some tubes replaced to bring
it back up to full output power. Includes manual and hand mic.

Heathkit HM-2140 dual HF wattmeter
- Includes manual and AC adapter.

10-mtr. dipole antenna (homebrew, less end connector)

Misc. amateur radio magazines (73, CQ, etc.) and test boooks.

$250 or best offer gets it. I would rather like to sell the whole thing
than rather piece it out. I would be extremely interested in trading
for a Atari Jaguar, or a Commodore 128D. If you have any questions, feel
free to e-mail me. Thanks for looking!

Source record: 217143

I have had the Yaesu FT-7400H for 440 mhz and have found,
as the adds claim, it is totally "bullet proof." I live in a very heavy
RF area near severa dense commercial sites and the unit is
connected to a Diamond X-50 at about 30 feet. The Icom
IC-47A that I had used to get blown away by the paging guys.
It was useless. I have yet to hear any intermod with the 7400. My
guess is that the 2M brother, the FT-2500, is the same.

>curious to know what experiences other users have had, particularly in
>regards to the wideband rx/tx mods - what coverage was actually
>obtained? Do the mods work on all models? any drawbacks? Is there a more
>easily obtainable diode than mentioned?

I have yet to actually open the unit and check for the diode, but my W21AT had
140.0-150.0 MHz transmit enabled when I got it; either that, or I accidentally
discovered some secret Vulcan Nerve Pinch on the keyboard that turned it on.

With the wide-band receive button-press, it tunes 50-300 and 300-999.99 MHz.
Sensitivity varies considerably, depending upon your distance from the amateur
segments; aircraft AM on 118 MHz works well; police on 461 MHz are inaudible
(at least with my unit). I haven't done much checking on other portions of
the spectrum.

>Also, I get really lowsy reception on 162.55 wx channel w/the rubber
>duck supplied, but fine on a cheapo scanner antenna - is the duck that
>narrow band????

Yes; putting it on the AEA VHF/UHF analyst (and assuming the readings are
anywhere near valid in this configuration) the useful frequency range of the
antenna is roughtly 140-150 MHz.

>those buttons are too small :-(

So are the labels, at least to someone my age.

From: raiar@vulcan.inlink.com
Message-ID: <3qd1l7$55g@news.inlink.com>
Source record: 216999

The company I work for is on the business trunkline for communications. Although converting my HT to work on the band does render it as non-type accepted for use on that band as far as the radio is concerned, it sure beats lugging around that old monster motarola radio that the company provides.

I get clearer reception, better transmissions at a lower power and the convenience of having a modern lightweight HT in my pocket rather than a lunchbox sized HT sagging my belt.

I'm not completely familiar with the way the FCC writes there rules or how type acceptance is determined, but I don't know of any licensed amateur operator who was operating otherwise legally on an out of amateur band that he was also licensed for ever being cited by the FCC for using a non-type accepted radio, that was designed for unlicenced operators to use on a licensed business frequency.

If you are licensed to use the frequency, and you are licensed as a ham, I think the FCC overlooks the mute type acceptance requirement designed to keep non-licensed operators from altering there equipment, usually to boost power and cause harmonic radiations (interferrence) to other services.

From: mlazaroff@delphi.com
Message-ID: <hI9dUDF.mlazaroff@delphi.com>
Source record: 217058

Richard Todd Perry <perryrt@clark.net> writes:

>This note brings up something that I've always wondered about... Exactly
>what does MARS use in the VHF/UHF spectrum anyway?
>
>I've "used" MARS stations to contact my folks while I was stationed
>overseas, but it was always HF gear. What does a MARS operator need
>a VHF HANDHELD for? I really don't know much about the MARS system,
>but I don't know of any situation where that would be useful.
>
>Somebody please let me know?

MARS has VHF simplex and repeater freqs for local use in both emergency
situations and to pass traffic locally. We often pick up messages for
stations reachable on a local VHF link who, for one reason or another,
cant get on the region and area HF freqs (antenn restrictions, etc).

Also, local emergency or contingency situations often dictate that statewide
or better coverage is not desired or necessary, so VHF is used.

>Also, now that I'm out of the military, how does one join a MARS net?

Depends which service you're interested in. The Army, Navy, and Air Force
run separate programs (although they do co-operate somewhat with each other).
For Air Force, you can write to HQ AFC4A/SYXM, 203 W. Losey St, Room 3065,
Scott AFB, IL 62225-5236 and they can guide you from there. Perhaps some
Army and Navy types will read this and clue you in on how to join thxx
their system (you can belong to only one at a time).

Unfortunately, the use of HAM gear in the fire service is ILLEGAL. I too am a ham operator and a firefighter. Commercial radio gear has FCC type acceptance which ham gear does not. The use of amateur gear on commercial radio frequencies is illegal. However, the use of commercial gear on both commercial AND amateur frequencies is completely legal. You might consider a commercial rig like the Kenwood TK-250 that will let you use both the ham frequencies and the commercial fire and rescue frequencies.

Casey,

I've generally found Ross Distributing, Box 234, Preston, Idaho 83263 to have the best prices on new equipment. I believe they also sell used gear, but I'm not familiar with that. Their phone number is (208) 852-0830. I don't believe they offer a catalog.

For used gear, I would try them and Radio Recyclers, 7730 W. National Avenue, West Allis, Wisconsin 53214 phone (414) 771-7121. I bought my TS940SAT from them.

To know which models of used gear to look for, ask around at your local ham club AND buy volumes 1 and/or 2 of the ARRL's "Radio Buyer's Sourcebook".

I have several Collins 208U-3 3-Kw 2-30Mhz RF Linier Amplifiers
that were recently removed from a USAF station here in California..

They were well maintained since installation in 1975 and are in excellent
condition. They could be used for radio amateur or commercial service.

They require only 0.2-watts to produce 3-Kw pep or average output. A
4CX3000A tube is used in the final stage. The primary power needed is 200
to
250v 3PH 47-60Hz.

These are automatically tuned with a servo system that takes about 10
seconds
to change frequency.

I can supply these superb units fully tested with manuals and guaranteed
ready to install at $7500.00 crated price FOB California.

Please contact me for more details .

4488. Alinco DR-590 mic on a DR-570

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: kd4cim@vulcan.com
Message-ID: <aB9u6c2w165w@vulcan.com>
Source record: 217073

Howdy, I have an Alinco DR-570 and have gotten a mic from a DR-590. The audio level from the 590 mic is low when using the 570.

The real problem with the 570 mic is that is has these obnoxious buttons to change frequencies such that with a slight tap, you are on another repeater from what you intended. The 590 mic has the frequency chaange buttons recessed in the body and also had a lock for the freq change buttons and the DTMF pad.

I disabled the freq change buttons on the 570 mic and that stopped the problem of strange jumps in frequency. However, the mic from the 590 still has the DTMF pad disable switch.

Any suggestions as to methods of increasing the audio gain of the 590 mic would be appreciated as I find it to be a superior mic in a number of features. Just that the audio is low when going into a DR-570.

Thanks....

Radio Shack HTX-212
anyone know of a mod to allow memories to store freq's outside of ham bands. The vfo will rx
these freq's, but memories will not allow them to be written to. do not want to tx on these freq's
only want to monitor local fire/rescue
thanks, Tim, NZ8J

thing let me know.

4493. Yaesu FT8500

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.62.0014C159@facstaff.wisc.edu>
Source record: 217078

I saw the Yaesu FT8500 at a recent promotional and was impressed that the "microphone from hell" as someone aptly called in here, actually seemed usable. I did not inadvertantly hit any buttons on the back while simulating speaking into the front of it.

However - are there any actual USERS of an 8500 who can comment if this is worth the extra $$$ over an FT5100, a set I was seriously thinking of until this came out? In particular, have they improved the intermod rejection so needed in urban settings?

4495. Need extended TX mods for Standard C5600D

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: patrick@thorax.xs4all.nl
Message-ID: <3qd0i1$8i4@news.xs4all.nl>
Source record: 217080

Hoi,

Nowadays I have a 23cm transverter, a LT23S opt. 1 from SSB-electronics, which needs a 2 mtr signal input. Ofcourse the Standard is limited to the appropriate band, but that must change if I want to enjoy the transverter.

Any ideas are welcome.

Thanks in advance,

Patrick

4497. Mods for TH22-E

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: ACIARLO@ESRIN.BITNET
Message-ID: <95149.160829ACIARLO@ESRIN.BITNET>
Source record: 217082

For anybody who is interested, the mods for the TH22-AT that you can ftp from kilroy.jpl.nasa.gov in /pub/hamradio/Mods work also the TH22E; some points are worth noting:
- the modified set looses its european accent: the 1750Hz tone for repeaters is not any longer available, and the preprogrammed RX/TX freq. shift for repeaters follows the US plan.
- it is not necessary to move one diode from one position to the other: the TH22E has all the diodes in place, so it is sufficient to remove both D208 and D213
- scanning the band becomes practically impossible, as each freq. is sampled only once every several minutes
- the position of the two jumpers (W201 and -2) as depicted in the description of the mods is not correct for the TH22E: they are in fact much further away (does anybody know what they are for? they BEG to be cut!). Otherwise the description is very accurate
- as a further warning to the "caution" in the mod instructions, the diodes are REALLY small, and so closely packed together that the tips of ordinary tweezers do not fit in the space between the diodes: be prepared to work with very small tools.

4498. MFJ-490 Memory Keyer/Bencher Paddle Combo

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: gregl@iglou.com
Message-ID: <D9D4u5.JG@iglou.com>
Source record: 217083

Has anyone actually managed to get an MFJ-490 memory keyer with the Bencher paddle combo? It seems no retailer has it in stock and it's been backordered with AES for a couple of weeks. I'm wondering if I should just downgrade the order to the MFJ-422 standard keyer with Bencher paddle, but the idea of having a few memories is attractive to me.

The only drawback on that is that your (ham) radio is not type accepted
by the FCC for the service you are using it in. Yeah...yeah....everyone
is doing it...NOT ME though. That makes your radio subject to confiscation
and you subject to stiff fines. But....it only happens to the other guy.

I had a 530 which I purchased when they first came out. When I moded my unit, I had to actually remove solder from jumper pad 13... The newly manufactured 530's have a nice convenient green wire that is easy to access. You clip the green wire, and you have broken the bridge on pad 13. I was also told though, that with the units with the green wire are NOT capable of the 800MHz receive. Don't know why, but they disabled the 530's capability to receive 800 even after the mod...

4503. Re: Icom IC-W31A Modifications

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-29 00:00:00 UTC
From: Michael Bonham <mgbonham@delphi.com>
Message-ID: <BQ5901d.mgbonham@delphi.com>
Source record: 217088

Hi, If what they say is true, your w31 is basically the same radio as my Z1A. If that is so, you should be able to access all frequencies between 50-990.990Mhz. To do this Press the light button+B+Func+then Power button. If you have the same settings menus. Press Func+Set. Go to the Place menu, and change it to 10 or 100. This will allow you to key in any freq stated above. I havent figured out how to do the extended transmit yet. If you or anyone else figures that out, let me know. By the way, the extended receive is not very good outside the bands. But, it will do it.

>530's capability to receive 800 even after the mod...

There are actually 3 major groups of 530's relative to this mod, in
order of mfg. date:

1) no green wire, but 800 capable

These you actually have to desolder the jumper the hard way

2) green wire, but 800 capable (like mine)

The ideal situation - just snip the wire, hit the buttons, and
you have 800-950MHz continuous RX coverage (and extended TX too)

3) green wire, no 800

These are of the most recent manufacture (since summer 94?)
after the more stringent ban on cellphone-band-capable receivers went
into effect. Apparently these radios cannot be modified to receive
anywhere in the 800-950 MHz range.

:

E.F.Johnson makes stand alone recievers originally designed for telemetry
but would work for voice. The new OEM price is something like $150.00.
They're small, 2in x 4in x 1in. I was looking at them for a telemetry
priject, but the matching transmitter is not type accepted, which was a
problem for me, but not for Ham.

The model # is something like DM-3170 ??

I dont have the phone number but they're in Waseca, Minn.

Good luck

From: "Todd Owen"
Message-ID: <3qe4k5$1i0@freenet.vcu.edu>
Source record: 217093

If I purchases a set of wireless networking cards using the
5,750 MHz +/- spectrum, which is within the ham band, as a ham
am I allowed to boost the transmitters output power to achieve
greater distances between PCs?

This is similar to the question of boosting the power to 900MHz
spread spectrum telephones.

Is this practice prohibited by the FCC?

Please e-mail me if you have a mike that will work with a Motorola Maxar 80, an 800 MHz mobile unit. The connector (as described looking at my 'box') is round with a metal shield, and black plastic body. There is a notch cut into the plastic at one point, and the opposite side is flattened (imagine a "D" with a dimple on the rounded part). There are five female conductors, arranged with one in the center, two near the flattened side, and two towards the notch. The ones near the notch are more widely spaced than the ones towards the flattened side. Thanks!

From: Tom.Eyring@ucsd.edu
Subject: "Superb" intermod rejection

I have had the Yaesu FT-7400H for 440 mhz and have found,
as the adds claim, it is totally "bullet proof." I live in a very heavy
RF area near severa dense commercial sites and the unit is
connected to a Diamond X-50 at about 30 feet. The Icom
IC-47A that I had used to get blown away by the paging guys.
It was useless. I have yet to hear any intermod with the 7400. My
guess is that the 2M brother, the FT-2500, is the same.

Subject: FS: Swan 270B trans + acc

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works fine, but it needs some tubes replaced to bring
it back up to full output power. Includes manual and hand mic.

Heathkit HM-2140 dual HF wattmeter
- Includes manual and AC adapter.

10-mtr. dipole antenna (homebrew, less end connector)

Misc. amateur radio magazines (73, CQ, etc.) and test boooks.

$250 or best offer gets it. I would rather like to sell the whole thing
than rather piece it out. I would be extremely interested in trading
for a Atari Jaguar, or a Commodore 128D. If you have any questions, feel
free to e-mail me. Thanks for looking!

>antenna. I've had some trouble trying to use this on 40m.

A few questions first -

1. Are you using coax or ladder line to feed the dipole?

2. If ladder line, are you using an external balun or does the T-1000 have one
built-in? (I'm not familiar w/ this particular tuner.)

3. Again, if ladder line, is any part of the line touching any non-insulated
objects
or structures?

4. If coax, are you using a balun at the center of the dipole?

5. How is the dipole supported? Are the center and end insulators a
commercial product? If not, what material are they made of?

6. Are the legs of the dipole constructed of insulated or bare wire? Is any
part
of it touching a painted surface (such as part of your house or other
structure)?
Is any part of it in contact with foliage such as tree limbs, leaves etc.?

The answers to these questions will hopefully provide a few clues that will
help to track down the problem.

Subject: INFO WANTED ON BENDIX-KING HTs

Greetings!

I have owned several Bendix/Kings, and the police dept I work for uses
them as well. I have never seen one that does the Ham bands, in fact the
lowest I have seen one go is about 150 Mhz
even. These radios I have used go up to about 176 179? somewhere in there.
There are also UHF models available. Quite a few federal agencies have
used them, such as the local Border Patrol, and National Parks Rangers at
numerous parks. I haven't noticed if they still carry them or not. As to
the issue of keyboard programming.... The older models are good to go
LPH 5141 etc.
The newer ones are not as easily programmable, but I have heard that it is

possible. On the older ones, you have to short two pins on the side connector to enable programing mode.

Most used ones that I have purchased, cost me no more than $300 each w/o accessories.

Hope this has been helpful...

That is just plain wrong. Evaluating the equation correctly gives a result of
87.67 ohms. Of course, everything that follows which depends on the value of
the resistor needs to be recomputed as well.

From: lager@primenet.com (Woody Harper)
Subject: Help with IC-24ET Until I Get A Manual.

Hi all. Just picked up a couple of IC-24ET sets and need some help. I do
not yet have a manual for these radios and have some questions. First,
the fellow I got them from says that they have had a diode installed to
expand their coverage. I do not know which diode though so I think I will
just have to rely on the display to give me information. Is it true that
I should be able to receive any frequency that I can dial up? The
frequencies that I can display are as follows:

.00 to 354.97
and
355.00 to 1310.00

Does this mean I have complete coverage from 0 to 1.3Gig? I am a total radio rookie so please be kind. Thanks.

Subject: ICOM IC-W21AT & mods feedback requested

I have a W21E which lacks the keypad but otherwise the same. I did hear about a mod with some diode that allows continuous tx but it sounds messy and I don't know if I really want to transmit on police freqs. I would mind however to have the full 420-450 coverage since if I ever go to the US I won't be able to use my rig since I only have 430-440 tx and all your repeaters and contacts are between 440-450.

Mine has cont rx with reasonable sensitivity from around 75MHz to 945 MHz without any mod whatsoever.

Could you please forward me comments from others about this rig.

Subject: MFJ Hi-Q vs AEA Iso-Loop

>I have a AEA loop and have used the MFJ one at a friends. The one big difference is the AEA loop is a much higher quality product.<

I have both antennas. But the MFJ in a side by side test actually works slightly better than the AEA! Although I agree the AEA looks better.

>In addition it has a much larger capacitor than the MFJ does. The plate spacing is greater because higher voltages are generated. This means the antenna is higher Q.<

Actually the AEA capacitor hurts the Q. It is longer and thicker, and has more bulk, but the length actually hurts the Q. The best capacitor is as square sized as possible. Long capacitors add series reactance, and that lowers Q drastically. The plate spacing is only part of the voltage rating, the smoothness of the plates is also very important. My AEA loop has sharp edges on the capacitor, and that lowers the voltage breakdown drastically.

If you want to measure the Q, do a simple SWR test as you move the transmitter freq.. Set both loops to the same freq, and first test one and then the other for BW using the same coax, SWR meter, and antenna mounting position. If you do this test, and if the loops are made the same way they were a couple years ago, the MFJ will be sharper. That indicates higher Q and efficiency.

From: w6go@netcom.com (Jay O'Brien - W6GO)
Subject: Mod to allow IC-38A xmt 219MHz?

The Icom IC-38A covers 215-230 MHz on receive and 220-225 MHz on transmit. For initial path tests in the new point-to-point fixed digital message forwarding system 219-220 MHz band, it would be useful to be able to transmit using an IC-38A between 219 and 220 MHz.

Neither ICOM America or ARTSI, publisher of Radio/Tech Modifications, has any information on such a modification.

Any information which could be used to disable the transmit inhibit to allow transmission between 219 and 220 MHz would be most appreciated. Perhaps someone in Japan who reads this message has a friend who knows the firmware in the IC-38A? My guess is that a diode matrix must be changed (a diode snipped or a diode installed) and then the micro-processor must be reset, but I'm not going to experiment!

From: w8jitom@aol.com (W8JI Tom)
Subject: Questions on Dentron 1200 L linear

Hi Kevin,

>1) Does Dentron still exist? I can't find it in the advertisers indexes in the usual magazines. Some of the Ameritron gear looks similar, and is Ameritron related to MFJ? (Clue, I've always been a 'barefoot' kind of guy - so I haven't paid a lot of attention to the amplifier world)<

No. Dentron was a different company that went bankrupt years before Ameritron started. Ameritron and Amp supply were staarted by the old principle of Dentron, Dennis Had, with financing from Prime Instruments (whom I worked for) and when the bills weren't paid Prime took Ameritron away. So some of the features may look the same but all "Dentron" influences stopped almost as soon as they started.

>2) Does anyone know how the 10 meter mod is done? This one wasn't modified, and if Dentron isn't still around I'll need to get the data someplace. Will I need switch parts?<

Probably you will need switch parts, but I am not positive.

>3) Realistic output levels? It talks about a kilowatt or so input, I'm presuming that the output will run 500-600w - which is all I'm really looking for, 6 db or so up from my regular output of 100 watts and let the exciter loaf at 10 watts on SSTV.<

With the 572's it should do that.

>4) I'm curious as to whether this amp can switch quick enough to use for PACTOR. I mostly run barefoot at 25 watts or so for that mode, but sometimes it would be useful to run some more (again, I'd probably let the exciter loaf and only run about half power). I don't think I'd run it with AMTOR, as that switching cycle seems like it would really be rough on relays, but PACTOR doesn't seem quite so bad. I haven't had the case off yet - does anyone know what kind of relay is used for switching?<

The relay used in that amp will switch modes in around 10 to 12 mS.

From: Scott_Rider@CCM.jf.intel.com (Scott Rider)
Subject: Smoke Escaped from FT-530

While examining my "high serial number" FT-530 UHF board,
I reassembled it and accidently contacted the hot lead from
the aux power input (next to the ant. BNC connector) to
a part of the case that is tapped for a screw.

When I reattached the battery, some smoke escaped. I am now
repairing damage to the flex cable that brings power from
the plug to the connector at the bottom of the UHF and VHF
"mother" boards.

So, CAUTION, when reassembling FT-530 UHF board, make sure it
is pulled "down" away from the BNC and power connector so you,
too, don't let out some of the smoke.

BTW, I still cannot find the "missing" components after a
serious schematic tracing session and side by side comparison
with an early unit that receives the 800-900 public service and
ham range. Guess it's signal tracers and o-so-silly-scopes
from here unless someone out there knows anything.

From: cap2624@osfmail.isc.rit.edu (Juan Epsteine)
Subject: TH79A: My mod experience.

I recently performed the wideband RX/TX mod on the 79A (discussed in
v1.5 of the TH79A file on oak.oakland.edu). The diodes were small. I
used a magnifier, a sharp soldering iron with a copper wire wraped
around the tip to extend the tip to the end of the wire, and a dentist's
pick. Was not too bad. Worked fine, and cleared my memory as
expected. No noticable increase in intermod.

The clone function works, I cloned my TH79A (moded) from a TH79A(D). It
takes about 5 mins. For the record: THE CLONE IS COMPATABLE BETWEEN
UNITS. Cloning sends the 80+LIMITS+CALL memories. It sends the
frequency, ID, and possibly PL tones. It does not send DTMF memories.
It does not send the power on message tag.

>Whoa there!!!!!!
>
>Using an Alinco, or virtually any other amateur radio out of bands other th
>an
>ARES or MARS bands is ILLEGAL!!!!!

This note brings up something that I've always wondered about... Exactly
what does MARS use in the VHF/UHF spectrum anyway?

I've "used" MARS stations to contact my folks while I was stationed
overseas, but it was always HF gear. What does a MARS operator need
a VHF HANDHELD for? I really don't know much about the MARS system,
but I don't know of any situation where that would be useful.

Somebody please let me know?

Also, now that I'm out of the military, how does one join a MARS net?
What can I do?

From: Tom.Eyring@ucsd.edu
Subject: "Superb" intermod rejection

I have had the Yaesu FT-7400H for 440 mhz and have found,
as the adds claim, it is totally "bullet proof." I live in a very heavy
RF area near severa dense commercial sites and the unit is
connected to a Diamond X-50 at about 30 feet. The Icom
IC-47A that I had used to get blown away by the paging guys.
It was useless. I have yet to hear any intermod with the 7400. My
guess is that the 2M brother, the FT-2500, is the same.

Subject: FS: Swan 270B trans + acc

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works fine, but it needs some tubes replaced to bring
it back up to full output power. Includes manual and hand mic.

Heathkit HM-2140 dual HF wattmeter
- Includes manual and AC adapter.

10-mtr. dipole antenna (homebrew, less end connector)

Misc. amateur radio magazines (73, CQ, etc.) and test boooks.

$250 or best offer gets it. I would rather like to sell the whole thing
than rather piece it out. I would be extremely interested in trading
for a Atari Jaguar, or a Commodore 128D. If you have any questions, feel
free to e-mail me. Thanks for looking!

>antenna. I've had some trouble trying to use this on 40m.

A few questions first -

1. Are you using coax or ladder line to feed the dipole?

2. If ladder line, are you using an external balun or does the T-1000 have one
built-in? (I'm not familiar w/ this particular tuner.)

3. Again, if ladder line, is any part of the line touching any non-insulated
objects
or structures?

4. If coax, are you using a balun at the center of the dipole?

5. How is the dipole supported? Are the center and end insulators a
commercial product? If not, what material are they made of?

6. Are the legs of the dipole constructed of insulated or bare wire? Is any
part
of it touching a painted surface (such as part of your house or other
structure)?
Is any part of it in contact with foliage such as tree limbs, leaves etc.?

The answers to these questions will hopefully provide a few clues that will
help to track down the problem.

Subject: INFO WANTED ON BENDIX-KING HTs

Greetings!

I have owned several Bendix/Kings, and the police dept I work for uses them as well. I have never seen one that does the Ham bands, in fact the lowest I have seen one go is about 150 Mhz
even. These radios I have used go up to about 176 179? somewhere in there. There are also UHF models available. Quite a few federal agencies have used them, such as the local Border Patrol, and National Parks Rangers at numerous parks. I haven't noticed if they still carry them or not. As to the issue of keyboard programming.... The older models are good to go LPH 5141 etc.
The newer ones are not as easily programmable, but I have heard that it is possible. On the older ones, you have to short two pins on the side connector to enable programing mode.

Most used ones that I have purchased, cost me no more than $300 each w/o accessories.

Hope this has been helpful...

(snip)
That is just plain wrong. Evaluating the equation correctly gives a result of
87.67 ohms. Of course, everything that follows which depends on the value of
the resistor needs to be recomputed as well.

From: dave@eram.esi.com.au (Dave Horsfall)
Subject: Modifying the Azden PCS-4000

Modifying the Azden PCS-4000

The Azden PCS-4000, popular some years ago, is a 25W mobile FM
transceiver. Functions such as frequency selection etc are performed
by a matrix of buttons on the front panel (and auxiliary buttons
on the microphone); there is no "VFO" control as such. The control
microprocessor continually scans this matrix; this scanning also
applies to the frequency display and other functions.

Many preset functions, such as band limits and step, are also under
the control of the matrix, and these are readily modifiable by the
user. NB: it is likely that other adjustments may have to be done
if the band edges are changed.

Call the scan lines K0 - K3 and R0 - R6 (using Azden's nomenclature);
refer to the circuit diagram for their location. Lines K0-K3 take
part in most operations, R0-R3 scan the keyboard, R4 scans the
"M-Mode" switch, R5 selects the step, and R6 the band edge. The
following are under control of these lines:

[O - Open, S - Short (diode)]

STEP
R5
5K 10K 12.5K 15K 20K 25K 40K 50K

K3 O O O O S S S S

K2 O O S S O O S S

K1 O S O S O S O S

By default, the rig is shipped (in Australia anyway) with steps of
5 and 10 KHz; to change to 5 and 25 KHz it can be seen that all
that is required is the addition of a diode at K3/R5. This can be
done anywhere, but I installed mine on the small PCB holding the
STEP switch behind the front panel; I prefer my mods to look as
though they were original.

BAND (2m version only)

R6
US JP EU
US: 142.000 - 149.995, 5 kHz
K3 O O O
JP: 144.000 - 145.995, 5 kHz
K2 O O S
EU: 144.000 - 145.995, 12.5 kHz
K1 O S O

This is of limited use, unless you were contemplating modifying
an imported set, in which case a realignment is probably necessary.

>How is the terminating resistance determined?
>Any help would be appreciated.

I'm not the resident guru on the theory part, I'll leave that to the other folks.

I know a few MARS ops who used this antenna. And in fact, I seem to recall that it was originally built for use as a military field tactical antenna. It does not radiate as well as a plain old ordinary dipole -- 10db or so relative loss seems to stick in my mind. What you give up in signal strength you gain in near flat SWR across across a wide spectrum.

On the other hand, since you're not on a battlefield looking out for incoming, you might have the few seconds needed to tweak a couple of knobs on a tuner ..... and put out a stronger signal to boot.

Subject: Stupid question about radio mods!!!

I'm with you. I can understand increasing the receive, but transmit? Although, I did have to modify a Kenwood rig for expanded TX to get the lower portion of the 440 Ham Band which I'm legally entitled to transmit. I don't know why they left it out.

Subject: Timewave DSP9+ Firmware version?

Eric,
I bought a DSP 9+ at Dayton and they rushed out the latest release for the

Hamvention. You should look for version 3.0.1 or later. I love my DSP 9+
and I think you will enjoy your DSP 9+ also.

Interesting. I don't have much problem with intermod, but I wonder about
my RS 2M amp's preamp; there seems to be little attenuation of signals
at 155 MHz and thereabouts. Anyone with this amp tried listening to
such signals, or NOAA weather at 162.<mumble> MHz, and found any
difference to speak of?

There a few minor differences. I believe there is only one Rx light, unlike
the Z1A which has one for each band. It was probably eliminated because it
is a smaller radio. Also, the Rx LED was located to the mic area. The W31A
is almost exactly like the Z1A except for the size, LED and non-detachable
face plate.

Subject: ICOM Battery BP-24 Question

[Article crossposted from rec.radio.amateur.misc]
[Author was Greg Tupper]
[Posted on 28 May 1995 00:31:43 GMT]

I have an ICOM BP-24, and no longer have the wall charger for
it. The local electronics shop/ HAM shop did not have any
information on the battery pack and were unable to help me.
I would like to know the specs of the pack and the voltage to
apply to either or BOTH the ports on the pack.

A note on the back of the battery states "Charging this battery
with the CM-16 or BC-16 wall charger while attached to an operating
handheld...." So the specs for either of the two charging units
specified would probably help also.

Thanks

PRC-127 early models covered 144 - 160 Mhz. The Army paid abt $1000 each. A number of commercial, local, and federal agencies use these and the stealth models. They work well and are rugged. Once programmed, even a grunt can use one.

I'm considering buying a Ford Ranger and was wondering if anyone has any experience installing HF, VHF and UHF rigs in them. Do they receive or produce RFI? Are there any problems with installation or antenna mounting?

I don't want to get stuck with a truck that has known RFI problems, so any information would be appreciated. Thanks.

The Drake gear, especially the seperates (R4 and T4) were quite good, but
their ergonomics were backwards from most other rigs. I have no clue why.

The Collins KWM-2A was really a very much compromised rig for a Collins
product. Collins fans, don't get your panties in a wad: I'm a Collins
collector myself. And I'm not itching to collect a KWM-2 or 2A, since I
thought the receiver on this transceiver was far, far below what Collins
75S3 series of products exhibited.

> I already own a Kenwood 520SE, which wasn't too difficult to find, but
>what is the availabilty like on the other good older stuff, and are there
>any dealerships etc. that would specialize in the used gear area?

Here are some other common rigs from the 70's:

- Henry Tempo-1. Nothing special about this. I guess you could
say "it worked OK", but nothing special about the rig.
- Heathkit SB-104 -- their first solid-state rig with tube finals.
In my limited playing with one, I found their receiver was OK, the
transmit audio needed some help.
- Swan rigs -- these were typically decent, solid performers for
people who knew what they were getting into. The Swan rigs were famous
for squeezing incredible amounts of power out of small TV sweep tubes.
The duty cycle on these tubes is definately not much over 50%; so things
like RTTY is a non-starter. They were great mobile rigs, because
of their high power output on SSB. Their receivers were not that good for
CW or other narrow modes.
- Yaesu FT-101 -- the Yaesu competition to the Kenwood -520. A good rig.

That's about all I've worked with when I was a kid.

In article <3qb62p$2i5@newsbf02.news.aol.com> edandsusan@aol.com (EDANDSUSAN) writes:
[Why do extended TX mods?]

There are a few reasons to do extended TX mods, none of which involve kerchunking the cops (which, BTW, is a very good way to get caught...)

- TX in the 430-440 range: Most HTs (for some reason) only come with 440-449 enabled. With the new FM sats on 434 (and a local repeater's control link in that range), it is useful to be able to TX within the whole ham band

- Feeding a transverter. Use a 2M sideband rig feeding a transverter to work UHF/microwaves. As long as you don't radiate the 2M IF, it's OK

- As a signal generator. I used my IC24AT as a sig gen in the 460 range while working on some ideas here at work. Into a dummy load with a coax feeding the circuit in question.

I will not get into the emergency/because I can/etc. answers. Those are bound to stir up the flames. Just remember, Ham radios are *not* type accepted for any other service (police, fire, marine, etc.) No matter how convenient, you can't legally use your HT for those purposes...

i would recommend going down to the bookstore and picking up a copy of
73 Amateur Radio Today, CQ, and QST (if that one's available). I would also
recommend a membership in the ARRL ($31 i believe..get QST as a benefit).

also check out the libraries -- and go to some radio club meetings (if you
don't know of any near by, i would suggest calling the 800/32-new-ham
number at the ARRL and get a prospective ham kit...)

>I have owned several Bendix/Kings, and the police dept I work for uses
>them as well. I have never seen one that does the Ham bands, in fact the
>lowest I have seen one go is about 150 Mhz

Most of the B/K high band HT's cover 148 to 174MHz from the factory
and can be modified to cover down to 144MHz. Look at the suffix on
the radio's uP to tell:

/00 - can't be forced below 148MHz (oldest models).
/01 - internal resistor jumper extends coverage to 144MHz w/
keyboard programming.
/02 - can be programmed to 144MHz with dealer software only
(newest models).

However, the model you have was manufactured for the military in
their low band split. It should be prgrammable from 136 to 160MHz
without modification.

I know that it is not a good idea to connect station ground to your water pipe. But, I am going to run about 50' of copper pipe near the shack, and I could isolate it from the rest of the house with a section of PVC pipe. Under this scenario, would it be a good idea to connect station ground to the pipe.

Thanks, Michael Raider, KO6BC

4537. Info needed on 2 meters in UK

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-30 00:00:00 UTC
From: crowner+@osu.edu
Message-ID: <crowner+-3005951538330001@crowner-mac.acs.ohio-state.edu>
Source record: 217023

I just found out I'm going to be visiting the United Kingdom in a few months. I've heard that many repeaters in the UK require a 1750 hz tone to come up. I've heard lately that there is a conversion going on to allow the use of CTSS tones in addition to or in place of the 1750 hz tone.

The brilliant minds at Kenwood designed my TH-79AD so that I can't transmit a 1750 hz tone (according to the folks at Universal, where I bought it). I guess the Kenwood designers never get to travel.

Can anyone from England/Scotland give me an idea as to whether or not it will be useful to carry along a 2 meter radio without 1750 hz tone capabilities? I don't mind carrying it if I can use it, but I'd hate to carry it around for 10 days without being able to bring up a repeater anywhere. (On trips like this one I try not to carry anything I won't be using at least once.) I'll be mainly in London and Edinburgh/Glasgow, and points in between.

Thanks in advance for the help.

Yes!! It's SUPPOSED to do that! It's supposed to attenuate signals outside of the 144-148 MHz band in order to reduce/eliminate the intermod problem. I wondered the same thing when I first hooked it up - why is the weather channel so much weaker with the amp.... ;-)

4545. Shielding radios from computer-generated RFI

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-30 00:00:00 UTC
From: terry@venus.sunquest.com
Message-ID: <3qg5ut$qlk@odin.sunquest.com>
Source record: 217031

I have some non-PC computer equipment at home, located about 8 feet away
from my ham equipment. One piece in particular generates so much crap
that it completely wipes out my Icom HF rig (WWV is unreadable on 10 MHz!).
With the computer equipment turned off, everything is nice and quiet.

The problem is that I don't want to turn off the computers to use the
radio; it makes the computer control software I've written rather useless.

So the question is how best to shield the radios from the computers. How
about something like a grounded copper mesh curtain I can draw to enclose
the computer area? How do I determine whether I'm getting leakage into
the radio box or picking up the hash through the antenna?

Everything's grounded already ...

AdTHANKSvance for any assistance.

>
>WT
>KB2SRH

Make sure you understand, however, that you are BREAKING THE LAW when you do this. The ham units are NOT type-accepted by the FCC for transmitting use on the emergency frequencies. If the FCC catches you (and they are quite active in the Northeast now, from what I've heard), you WILL be fined, you will probably lose your ham license and any others you have, and you stand a chance (albeit a small one) of spending time in jail.

>anything we can do for you.
>>RULE NUMBER THREE: Establish a budgeted amount for your purchase. Try to
>stick to it, after you've received input from others in your area.
>>RULE NUMBER FOUR: Buy Standard Radio Equipment ONLY. <grin!>

I counldn't put it better. Rule #1 definitely. Ever meet someone who admitted he made the wrong choice after buying a new car or other major purchase? We're just too proud to do that. Rule #2 is a must as well. That's how you'll know what band(s) and features are important for your area, and also get to handle a lot of different radios with someone who knows what they do and don't do right there. Rule #3 is probably more important to some than others. After all, if you really wanted the BEST... But there's no question about #4. I have 3 of them (168, 178, and 508). Refer back to rule #1 when I say they're great. And Standard doesn't make you pay extra for CTCSS encode/decode or look all over for the "mod" for extended receive, they do both right out of the box.

4552. Amplifier for Ten-Tec Scout?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-30 00:00:00 UTC
From: Bryan P King <kingbp@delphi.com>
Message-ID: <Be89s3S.kingbp@delphi.com>
Source record: 217038

I am interested in using an RF amplifier with the Ten-Tec Scout. The maximum output of this rig is 50w. The Ten-Tec service manual states that a jumper is available on one of the boards to bring out automatic control of an amplifier. The manual goes on further to state that doing so should be completed by a skilled technician and that no modifications are available for the factory on how to accomplish this as there are several different methods.

Since the Scout has first been manufactured, have any mods been made available to control an external amplifier?

Is it possible to drive an amplifier with as little as 50w of power? I have been thinking about Ameritron's amplier, the 811. It requires only 75w of rf from the transmitter to produce 600w to the antenna.

Thanks in advance for any information related to this topic.

dsa@netcom.com (David S.A. Stine) wrote:

>- Heathkit SB-104 -- their first solid-state rig with tube finals.

Just wanted to mention that the SB-104 and 104A were both fully solid state, including the finals. I know, because mine blew up three times before I sold it. By the third time it happened, the pattern had repeated itself enough for me to realize where the problem was - the heatsink for the finals was too small.

I had an SB-102 (all tubes except the VFO) before the 104A, and it was much better equipment, IMHO. My only complaint at the time was the lack of receiver offset tuning.

BTW, you're correct about the FT-101, it *is* a good rig. I'm still using the one I bought used about seven years ago. <g>

Don't forget that these these rigs don't include the WARC bands, and most don't have provisions for adding three new bands. Unless there's something unique about the rig, or you have a special use for it, rigs from the early 80's might be a better choice. For serious CW work, Ten-Tec seems to have an edge (full break-in that really works).

I just got my Kenwood TH-79A(d) after much recommendation from you guys, and love it... it's a very nice, small, powerfull unit. So, my next step is to jump into the packet arena. I have a 486/33 laptop with a serial port and would like to get a small TNC (pref. one that has many features, 9600 baud would be nice as well), that I could interface with my laptop and Kenwood HT. The band was just broken with the HT purchase, but I don't mind spending a bit extra to get a nice TNC. Could someone tell me the top two or three models in production right now, so I can't go from there?
Thanks a bundle,

>>RULE NUMBER FOUR: Buy Standard Radio Equipment ONLY. <grin!>

I counldn't put it better. Rule #1 definitely. Ever meet someone who
admitted he made the wrong choice after buying a new car or other major
purchase? We're just too proud to do that. Rule #2 is a must as well.
That's how you'll know what band(s) and features are important for your area,
and also get to handle a lot of different radios with someone who knows what
they do and don't do right there. Rule #3 is probably more important to some
than others. After all, if you really wanted the BEST... But there's no
question about #4. I have 3 of them (168, 178, and 508). Refer back to rule
#1 when I say they're great. And Standard doesn't make you pay extra for
CTCSS encode/decode or look all over for the "mod" for extended receive, they
do both right out of the box.

Subject: ICOM Battery BP-24 Question

[Article crossposted from rec.radio.amateur.misc]
[Author was Greg Tupper]
[Posted on 28 May 1995 00:31:43 GMT]

I have an ICOM BP-24, and no longer have the wall charger for
it. The local electronics shop/ HAM shop did not have any
information on the battery pack and were unable to help me.
I would like to know the specs of the pack and the voltage to
apply to either or BOTH the ports on the pack.

A note on the back of the battery states "Charging this battery
with the CM-16 or BC-16 wall charger while attached to an operating
handheld...." So the specs for either of the two charging units
specified would probably help also.

Thanks

PRC-127 early models covered 144 - 160 Mhz. The Army paid abt $1000 each. A number of commercial, local, and federal agencies use these and the stealth models. They work well and are rugged. Once programmed, even a grunt can use one.

Subject: Rigs of the Seventies

I am a new amateur interested in gear from the 70s. I have heard alot about the Drake gear from this time, but would also be interested in hearing opinions about other rigs. The Collins KWM-2A or Ten tec OmniD would be examples of other rigs I would like to know about, but any opinions on class rigs from that time would be useful.
I already own a Kenwood 520SE, which wasn't too difficult to find, but what is the availabilty like on the other good older stuff, and are there any dealerships etc. that would specialize in the used gear area?
Thanks,
Chris VE6RDC

dsa@netcom.com (David S.A. Stine) wrote:

>- Heathkit SB-104 -- their first solid-state rig with tube finals.

Just wanted to mention that the SB-104 and 104A were both fully solid state, including the finals. I know, because mine blew up three times before I sold it. By the third time it happened, the pattern had repeated itself enough for me to realize where the problem was - the heatsink for the finals was too small.

I had an SB-102 (all tubes except the VFO) before the 104A, and it was much better equipment, IMHO. My only complaint at the time was the lack of receiver offset tuning.

BTW, you're correct about the FT-101, it *is* a good rig. I'm still using the one I bought used about seven years ago. <g>

Don't forget that these these rigs don't include the WARC bands, and most don't have provisions for adding three new bands. Unless there's something unique about the rig, or you have a special use for it, rigs from the early 80's might be a better choice. For serious CW work, Ten-Tec seems to have an edge (full break-in that really works).

Unfortunately, the use of HAM gear in the fire service is ILLEGAL. I too am a ham operator and a firefighter. Commercial radio gear has FCC type acceptance which ham gear does not. The use of amateur gear on commercial radio frequencies is illegal. However, the use of commercial gear on both commercial AND amateur frequencies is completely legal. You might consider a commercial rig like the Kenwood TK-250 that will let you use both the ham frequencies and the commercial fire and rescue frequencies.

Make sure you understand, however, that you are BREAKING THE LAW when you do this. The ham units are NOT type-accepted by the FCC for transmitting use on the emergency frequencies. If the FCC catches you (and they are quite active in the Northeast now, from what I've heard), you WILL be fined, you will probably lose your ham license and any others you have, and you stand a chance (albeit a small one) of spending time in jail.

Subject: Stupid question about radio mods!!!

In article <3qb62p$2i5@newsbf02.news.aol.com> edandsusan@aol.com (EDANDSUSAN) writes:
[Why do extended TX mods?]

There are a few reasons to do extended TX mods, none of which involve
kerchunking the cops (which, BTW, is a very good way to get caught...)

- TX in the 430-440 range: Most HTs (for some reason) only come with
440-449 enabled. With the new FM sats on 434 (and a local repeater's
control link in that range), it is useful to be able to TX within the
whole ham band

- Feeding a transverter. Use a 2M sideband rig feeding a transverter to
work UHF/microwaves. As long as you don't radiate the 2M IF, it's OK

- As a signal generator. I used my IC24AT as a sig gen in the 460 range
while working on some ideas here at work. Into a dummy load with a
coax feeding the circuit in question.

I will not get into the emergency/because I can/etc. answers. Those
are bound to stir up the flames. Just remember, Ham radios are *not*
type accepted for any other service (police, fire, marine, etc.) No
matter how convenient, you can't legally use your HT for those purposes...

Subject: Yaesu FT8500

I saw the Yaesu FT8500 at a recent promotional and was impressed that the "microphone from hell" as someone aptly called in here, actually seemed usable. I did not inadvertantly hit any buttons on the back while simulating speaking into the front of it.

However - are there any actual USERS of an 8500 who can comment if this is worth the extra $$$ over an FT5100, a set I was seriously thinking of until this came out? In particular, have they improved the intermod rejection so needed in urban settings?

I had a 530 which I purchased when they first came out. When I moded my unit, I had to actually remove solder from jumper pad 13... The newly manufactured 530's have a nice convenient green wire that is easy to access. You clip the green wire, and you have broken the bridge on pad 13. I was also told though, that with the units with the green wire are NOT capable of the 800MHz receive. Don't know why, but they disabled the

530's capability to receive 800 even after the mod...

I bought a new MFJ-949E a few weeks ago to go with my new Icom IC-701 HF rig. Well, the rig is used but new to me. So far it seems to do a fairly decent job. I live in an apartment and stuck a dipole (72 feet long) in the attic. I can use the MFJ-949E to tune the antenna on 80, 40, 20 and 10 meters. Of course the antenna leaves a bit to be desired on 80 meters, but it does tune it.

I also like the fact that the antenna switch is on the front and that it has lighted cross-needles. No need to worry about SWR since I can readily see the actual reflected and forward power at once.

A todos los radioaficionados hispanos que lean este E-Mail los invitamos a escuchar RADIO INTERNET EN ESPANOL que se transmite por esta red. Para hacerlo solo sigan las instrucciones y si tienen cualquier consulta escriban a miglia@ix.netcom.com.

EL TERCER PROGRAMA DE RADIO VIA INTERNET ESTA YA ON LINE, ESCUCHELO.

Tal cual lo programado a las 11:59 PM del Sabado 27 de Mayo fue colocado en nuestro FTP el tercer programa de Radio en Espanol Via Internet y como ya se volvio casi custumbre los radio escuchas comenzaron a bajarlo solo pasados algunos minutos de la media noche. Es notable ver desde que remotas latitudes hay latinoamericanos que ingresan a disfrutar de esta experiencia, nunca pensamos que nuestra gente estaba repartida por toda la tierra como lo esta. A todos muchas gracias por escucharnos y aqui algo de informacion:

Programacion Radio Internet en Espanol

051495.ra Primer Programa Tema Central "Internet Phone" Como Hablar Via Internet (New HF)

052195.ra Segundo Programa Tema Central "Videoconferencia Via Internet"

052895.ra Tercer Programa Variedad de Temas y Demostracion Internet Phone

Espanol.ra Archivo formato .ra para test

Leame.txt Este archivo

SINTONICE RADIO INTERNET EN ESPANOL YA ESTAMOS TRANSMITIENDO VIA LA RED

Si ahora es posible escuchar radio via Internet y nosotros pensamos que sera esta la nueva opcion que reemplazara las antiguas y ruidosas transmisiones de onda corta.
El proximo domingo 14 de Mayo comenzaran las transmisiones de los PROGRAMAS DE RADIO EN ESPANOL VIA INTERNET, dichos programas estaran disponibles en el FTP de nombre FTP.NETCOM.COM en los directorios /pub/mi/miglia y bajo el nombre correspondiende a la fecha de emision, por ejemplo este domingo 14 de mayo el file conteniendo al programa se llamara 051495.ra

FTP: FTP.NETCOM.COM
DIRECTORIO: /pub
SUBDIRECTORIO: mi

SUBDIRECTORIO: miglia
FILE: 051495.ra

PARA ESCUCHAR NUESTRO PROGRAMA DE RADIO EN ESPANOL VIA INTERNET

Para poder escuchar nuestro programa de radio en espanol debera contar con un software llamado RealAudio Player, una PC con Windows 3.1 y una tarjeta de audio. RealAudio lo podra obtener "SIN CARGO" dentro de Internet en:

http://www.realaudio.com/

Cuando este comunicado con esta pagina seleccione:
"donwload your own copy of the RealAudio Player"

Y siga las instrucciones completando la forma correspondiente con sus datos personales, las caracteristicas de su computador y por ultimo el tipo de cuenta en internet que esta usted utilizando. Esto lo ayudara:

A. Ingrese todos sus datos personales
B. Internet Connection = PPP
C. Provider = Por ejemplo NI.NET
D. Speed = 14.400 Baud
E. Machine and Sound = 486 DX2 66MHZ - Windows 3.1 - 8 MB - 340 MB Disco
F. Coloque su nombre el principio del PRE-REASE AGREEMENT

Completada esta informacion RealAudio le enviara de inmediato via
E-Mail un numero de registracion y un password. Con estos datos entonces regrese a http://www.realaudio.com/ y efectue el download del programa RealAudio Player.

1.- El programa obtenido (RealAudio Player) tendra un nombre similar a raplay07.exe.
2.- Ejecutelo colocando el comando raplay07.exe y ENTER.
3.- Este programa al ejecutarse genera un directorio de nombre RAPLAYER.
4.- Dentro de ese directorio encontrara el programa pnclient.exe que es el que utilizara para escucharnos.

Ahora bien para obtener nuestros programas de radio ingrese como ANONYMOUS al siguiente ftp:

FTP: ftp.netcom.com
DIRECTORIO: \pub
SUBDIRECTORIO: mi
SUBDIRECTORIO: miglia

O sea: ftp.netcom.com/pub/mi/miglia

Como Operar pnclient.exe desde Windows:

- Ejecute pnclient.exe
- Habra con el mouse el cuadradito superior izquierdo
- Selecciones Load...
- Seleccione Local File
- Con la ayuda de Browse... busque el file del programa con terminacion .ra en

su disco y seleccionelo.
- Oprima OK y disfrute de nuestros programas.

ESCUCHE CADA DOMINGO NUESTRO PROGRAMA DE RADIO EN ESPANOL VIA INTERNET
EL 21 MAYO TRATAREMOS COMO TEMA PRINCIPAL "VIDEOCONFERENCIA O TRANSMISION DE VIDEO COLOR VIA INTERNET CON UNA PC Y WINDOWS" FILE 052195.ra

Nota: A los 1.050 usuarios de internet que nos escribieron respecto a nuestro programa de radio, gracias.

George Migliarini
E-Mail: miglia@ix.netcom.com

4574. HABLAR VIA INTERNET Si ahora es posible

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-31 00:00:00 UTC
From: miglia@ix.netcom.com
Message-ID: <NEWTNews.25853.801935127.miglia1@miglia1.gmtech.com>
Source record: 216957
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc,rec.radio.amateur.antenna

ESTAN LAS BANDAS DE HF DESAPARECIENDO ?

Los amantes de las comunicaciones tienen ahora otra modalidad disponible y se trata de INTERNET PHONE, si asi como lo leen ♦Hablar via Internet♦ este sera el fin de las bandas de HF o solo un reemplazo cuando las condiciones de propagacion no nos ayuden. Para hablar por internet solo siga las instrucciones y les recomendamos escuchar nuestros programas en espanol de RADIO INTERNET EN ESPANOL, para ello busque mas informacion de como hacerlo aqui mismo o escriba a miglia@ix.netcom.com

Por ultimo los que tengan Internet Phone listo y operativo les regamos nos lo hagan conocer a nuestro E-Mail. Gracias.

AHORA PODEMOS HABLAR POR TELEFONO VIA INTERNET PHONE

Es dificil de creer pero miles de usuarios estan hablando via la red INTERNET y si usted tambien quiere hacerlo aqui le damos toda la informacion necesaria para poder realizarlo y contestamos algunas preguntas tambien:

Pregunta: Cual es el costo para poder hablar via INTERNET PHONE
Respuesta: Ni un centavo mas de lo que paga actualmente por su cuenta

Pregunta: Se escucha claro
Respuesta: Lo mismo que una llamada telefonica internacional

Pregunta: A donde puedo hablar via INTERNET PHONE
Respuesta: A cualquier parte del mundo

Pregunta: Con quien puedo hablar via INTERNET PHONE
Respuesta: Con cualquiera usuario de internet que este On Line y tenga INTERNET PHONE

COMO HABLAR VIA INTERNET

Para poder hablar por telefono via Internet hay que tener los siguientes elementos:

486 PC Computer
8 MB RAM
Windows 3.1
Winsock 1.1 compatible TCP/IP y coneccion a internet 14,400 baud modem (SLIP/PPP)
Tarjeta de audio compatible con Windows
Programa Iphone (Demo o version registrada)

Si esta confundido con los terminos TCP/IP y SLIP/PPP consulte con quien le da su servicio internet y pregunte si su cuenta reune estas condiciones. Respecto al programa Winsock 1.1 o compatible esta dispoble sin costo via Internet. Ahora bien la tarjeta de audio debe reunir la condicion de ser Windows compatible como el caso de Sound Blaster por ejemplo. Por ultimo le hara falta el programa IPHONE el cual lo puede obtener sin cargo en su version demo o pagando por la version definitiva.
Teniendo todos estos elementos usted podra entonces conversar con otros usuarios que esten On Line y que tengan tambien Internet Phone no importando en que parte del mundo esten y lo mas interesante no pagara nada adicional por este servicio solo lo que actualmente esta pagando. Para tener una idea NETCOM ofrece el servicio windows Netcruiser por $19 dolares al mes con 20 horas prime time y free el resto, esta cuenta reune las condiciones para utilizar IPHONE. Con Netcom no hace falta Winsock 1.1 esta ya incluido.

Para obtener IPHONE Demo (Sin Cargo) ingresar a:

http:///www.vocaltec.com/

Hacer el download del programa y seguir las instrucciones, el costo de la version registrada es de $59.00.

IPHONE Vocaltec Inc. (201) 768-9400 o E-Mail info@vocaltec.com

For Winsock Trumpet send E-Mail to tech-support@trumpet.com.au o busque que hay muchas versiones sin cargo en internet como por ejemplo ftp.utas.edu.au

LA CALIDAD DE LA VOZ VIA IPHONE ES CLARA LOS ESPERO ON LINE PARA CHARLAR

4576. Source for 6-pin mini-DIN connectors?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-31 00:00:00 UTC
From: eckman@eos1.larc.nasa.gov
Message-ID: <3qhm1p$1fl@reznor.larc.nasa.gov>
Source record: 216959

I recently purchased a Kenwood 2-meter rig which uses a 6-pin mini-DIN plug for its data (i.e., packet) communications line. Unfortunately, Kenwood didn't think to include a plug with the rig. As Radio Shack doesn't carry these, does anyone know of a mail-order source for these 6-pin mini-DIN plugs in small quantities? I know that Kenwood offers a cable assembly with the plug installed, but it's a bit pricey. Also, I see the plugs listed in a recent catalog from Newark electronics, but they have $25 minimum order requirements as well as a credit card surcharge.
Thanks, in advance, for any assistance.

For Sale:
U.S. Millitary Vietnam war era PRC25 FM radio, as seen lugged about in
many war movies.

Includes handset, whip antenna and homebrew 13.8V battery eliminator so
rig can be powered from cigarette lighter.

The radio covers 30-75MHz TX/RX with about one watt output.
Asking price is $230.

This big, heavy, ugly and green radio can survive drop test that would
leave modern HT's in chunks!

FOR info email me at jgg@iglou.com

Thanks,
Jim KQ4EL

>including the finals. I know, because mine blew up three times before I
>sold it.

Duh. You're right. Brain fart. Now I remember the rest of the bit about
this rig -- red LED freq readout, kinda jumpy on the frequency tuning
because it didn't have the more modern "damping" on the shaft.

>By the third time it happened, the pattern had repeated itself enough for me
>to realize where the problem was - the heatsink for the finals was too small.

There was that, as I now recall, and if I'm recalling correctly, it was
using bipolar transistors on the output? ie, when things get hot in a
bipolar amp, there is that little thing called "thermal runaway..."

>I had an SB-102 (all tubes except the VFO) before the 104A, and it was much
>better equipment, IMHO. My only complaint at the time was the lack of
>receiver offset tuning.

Yea. I should have mentioned the following rigs which I also used in some
Field Day contests:

- Heathkit HW-101 -- An OK rig. Very economical at the time, but if you
were running close to band edges, you wanted to
be careful, because you only got a dial calibrated
in 5 kc increments.

- Heathkit SB-101, 102 -- I never used the '102, but I used the '101 plenty
at my elmer's place. Other than the lack of RIT,
it really worked quite well.

The HW-101, SB-101 and SB-102 were all "classic 6146 final"
style rigs.

>BTW, you're correct about the FT-101, it *is* a good rig. I'm still using the
>one I bought used about seven years ago. <g>

All I remember about the Ft-101 was that it seemed to be more rig than the
Kenwood TS-520 at the time, even without a digital freq readout. I liked
the CW handling of the rig a bit better.

>Don't forget that these these rigs don't include the WARC bands, and most
>don't have provisions for adding three new bands.

Goes without saying... ;-)

>Unless there's something unique about the rig, or you have a special use
>for it, rigs from the early 80's might be a better choice. For serious CW
>work, Ten-Tec seems to have an edge (full break-in that really works).

Ten-Tec rigs are the one 70's and 80's rigs that I've never used. And I'm a
CW fanatic. Folks: please fill me in on the plus and minus points of the
Ten-Tec line. I've heard enough CW ops praise these things to pop for a
used one...

>
>TNX and 73 de VE7MDL ....Erik.

Erik,

They are on version 3.x. They announced it at Dayton. Just bought my DSP 9 a month earlier and told the guy at Timewave. He told me to send a copy of my receipt and they would ship the latest version at no charge. So I did and they did. The new version is a GREAT improvement. It is especially noticeable on voice. SSB audio is much higher in quality.

> I'm considering buying a Ford Ranger and was wondering if
>anyone has any experience installing HF, VHF and UHF rigs in
>them. Do they receive or produce RFI? Are there any problems
>with installation or antenna mounting?

I have owned a Ford Ranger in the past, it was VERY noisy, the "standard"
fixes DO work but they do take time and real effort! My new Ford F-150
is VERY quiet, I made it a condition of sale! THe chief noise source is
ignition, then the computer(s). ALL windshield wiper motors need to be
bypassed! Plan on replacing ignition wires every 20,000 miles.

Antenna's were no problem, but my wife did somehow manage to get the 5/8
wave roof mounted antenna threaded in the garage door handle, it ripped
right out of the roof!

Ask you Ford dealer to allow measurments of the intended truck,
my sales guy (John Aronis! Garvais Ford... shameless plug!)
actually knew what hams were, and had the fuel pump filters installed
before I returned on saturday to measure the vehicle moise.
?Moise? Must be low on coffee!
Anyway I tested on all ham bands, 80M - 450 Mhz. Except for the 50Mhz
birdy from the ignition computer, the truck was GREAT! Perhaps the new
trucks are better?

One funny: As I was looking at the spectrum analyzer, the noise floor
started to rise... Then it got REAL bad!... I wondered if the truck
got noisy after it heated... then I saw the CHEVY truck drive by...
then the noise went away... I had to tell the dealer!
(I know, unfair! but I have to contribute to the Ford-Chevy religous wars!)
>
> I don't want to get stuck with a truck that has known RFI

4585. Re: Stupid question about radio mods!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-31 00:00:00 UTC
From: gb546@bard.edu
Message-ID: <3qhrke$kot@core.bard.edu>
Source record: 216968

>I get clearer reception, better transmissions at a lower power and the
>convenience of having a modern lightweight HT in my pocket rather than a
>lunchbox sized HT sagging my belt.

When it comes down to it, most amateur transceivers fall far short of the
spectral purity requirements set forth for type acceptance.

>I'm not completely familiar with the way the FCC writes there rules or how
>type acceptance is determined, but I don't know of any licensed amateur
>operator who was operating otherwise legally on an out of amateur band that
>he was also licensed for ever being cited by the FCC for using a non-type
>accepted radio, that was designed for unlicenced operators to use on a
>licensed business frequency.

I don't want to embarras people in this forum, but I could list you
several calls of hams (and one ex-ham who had his license revoked for
repeated violations) who have been sanctioned, fined, and radios
confiscated for operating non-type-accepted equipment on non-amateur
frequencies.
>
>If you are licensed to use the frequency, and you are licensed as a ham,
>I think the FCC overlooks the mute type acceptance requirement designed to
>keep non-licensed operators from altering there equipment, usually to
>boost power and cause harmonic radiations (interferrence) to other services.
>

If that's your personal experience (not idle speculation), fine, but many
others have been nailed. The FCC (and any other enforcement agency, for
that matter) has certain discretionary powers, but it has been my
experience that they take the enforcement of commercial rules & regs much
more seriously than they do other areas (possibly because of the
large-scale abuse).

Be aware also that you jeapordize ALL your FCC licences by intentionally
violating FCC regs, NOT just your ham license. Fact is, what you're doing
is against the law (good law or bad law), and violating that law subjects
you to the penalties.

4586. TH79AD mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-05-31 00:00:00 UTC
From: km3t@bluesky.net
Message-ID: <3qhso5$5qd@news.bluesky.net>
Source record: 216969

I performed the mods described in the TH-79AD note at oak.oakland.edu.
The note mentions extended frequency coverage (67-174 and 400-511 MHz).
After performing the wide-band mod, I got 118-174 (normal VHF coverage)
and 410-470.

Is there a step I missed or a uP reset that wasn't described? Or is the
TH79AD somehow different than the TH79A?

Sure, bring it along. Once the repeater has been brought up and is open,
it is held open by simple carrier squelch. If you hear a repeater in use,
just chip in, and be careful to avoid over-long pauses between transmissions.

Hi,
I have one of these ordered since the first of the year and am still waiting.
From what I have found out is that MFJ moved and took a couple of months
to reset up thier manufacturing and then they said that it would ship and
never showed up so I called again and was told that they were waiting on
a circuit board to manufacture the keyers. I was also told about 2-3
weeks and that was about 1 1/2 weeks ago. Good luck in obtaining one.

Why not modify for TX in the whole 420-440 range, not just 430-440. Hams get the whole 420-450 MHz range in ITU Region 2, though 420-430 MHz is allocated to the amateur service in the United States on a secondary basis, and is allocated in the fixed and mobile (except aeronautical mobile) services in the International Table of Allocations on a primary basis. The 430-440 MHz segment is allocated to the amateur service on a secondary basis as well.

because your site only held the posting for that long. Nearly all sites
"expire" postings after they get old. In your site's case, "old" is 2 or
three days.

If postings didn't expire, your newsserver's storage would rapidly fill and
nothing else would come in. You wouldn't like that!

George

teeny speaker mics have teeny speakers, which aren't exactly "hi-fi"!

If you can handle the size, the larger speaker mics are much better
(and easier to operate).

Subject: Water Pipe Ground

I know that it is not a good idea to connect station ground to your water
pipe. But, I am going to run about 50' of copper pipe near the shack, and
I could isolate it from the rest of the house with a section of PVC pipe.
Under this scenario, would it be a good idea to connect station ground to
the pipe.

Thanks, Michael Raider, KO6BC

Dave,
No I dont, your post is the first I have heard of it. Although I am not suprised to hear of it, I think 1 factory turns out all of these and just puts anyone's name on it. Although ACE communications cant seem to get their stuff through type acceptance at the Flunked Clown College.
I was going to buy an AOR 8000 at Dayton but thought I would wait and talk to ACE. I talked to them last year and they said their 3800 would be about $480. I called them when I got back in town and they still have not recieved type acceptance. (might have some thing to do with fine they got last year?). The Ham Station had the AOR 8000 for $ 570 now they are $ 590. I sold my 1000xlt so I am with out a good hand held!

There are actually 3 major groups of 530's relative to this mod, in order of mfg. date:

1) no green wire, but 800 capable

These you actually have to desolder the jumper the hard way

2) green wire, but 800 capable (like mine)

The ideal situation - just snip the wire, hit the buttons, and
you have 800-950MHz continuous RX coverage (and extended TX too)

3) green wire, no 800

These are of the most recent manufacture (since summer 94?)
after the more stringent ban on cellphone-band-capable receivers went
into effect. Apparently these radios cannot be modified to receive
anywhere in the 800-950 MHz range.

From: jdonimi@nv2.uswnvg.com
Message-ID: <3qigep$eco@fred.uswnvg.com>
Source record: 216979

All you thrifty YAESU FT-530 owners, I have confirmed an alternate source of a power cord for the FT-530. It's made by PHILMORE and the part number is TC240. What you get for $2.95 is:

Molded DC plug 4 mm x 1.7 mm
Integral 6 foot mini "Zip cord"

I made up two special purpose power cords with these and both work PERFECTLY. I'm really thrilled. I even confirmed that these TC240 plugs fit SONY Discman players.

I use one to connect my FT-530 to an external 12 Volt battery for extended time use of my portable during parade communications (four long hours of operation at 5 Watts).

The other one is serving as an adapter cable to allow me to charge the battery from the top connector. It's such a pain to remove the soft case every time I need to charge the battery through the YAESU side connector. Now I just plug the YAESU wall cube charger, through my adapter, to the jack at the top of the radio. Did it last night and it charged it overnight.

Your biggest challenge may be to find a dealer of Philmore products. My parts came from Sparky Electronics in Fresno, CA. (209) 227-2986. I don't know if they deal via mail order or not.

Many thanks to a special friend in Fresno for alerting me to this find.

Source record: 216980

Hi John,

I have an 88 Ranger with 2.8L V-6 4WD and extended cab.

I run a Kenwood 741 with 2M 220 and 440 and a Kenwood 942 modified with 6M, 440 and 1.2G. I also have a Yaesu 747 for HF. All are on remote heads. There do seem to be a few spurs from the electronics in the engine. I recommend adding a high voltage ceramic capacitor at the ignition coil. This is added in parallel with the electrolytic capacitor already there. Take power straight from the battery; the wiring is not real robust like in a full size truck. I also have RF ferrite beads (radio shack type) on the ignition line and alternator/regulator output.

Rangers are shipped with a small battery and the battery replacement charts show a small battery replacement. The ranger comes with a large battery tray. If you are going to run a couple of FM radios get the biggest battery that will fit in the tray.

I find that HF transmissions at 21 MHz and 28 MHz upset the tachometer reading but has no effect on vehicle operation. It just seams to be a dashboard readout thing.

In general Rangers are widely used as fleet vehicles in industry and Government. This requires that they be at least a reasonable 2 way radio platform.

By the way mine has been a good truck for 90,000 miles.

A couple of tricks for you. If you have an extended cab with the fold down seats you can hide a remote head radio at the bottom of the compartment under the seat. If the seat is not there you can install any radio gear you can imagine. The snap on panel pieces for the cab are quite cheap. There is space behind the plastic for screw ends, so just buy an extra panel for where you want to install a control head and screw it right in plastic panel. When you want to sell the truck just whip the other one out of storage and install it. The underside of the dashboard pad area is also an excellent place for control heads.

Good luck,

Bill Harwood

: Thanks john k3nxu jlamar@yrkpa.kias.com
:

E.F.Johnson makes stand alone recievers originally designed for telemetry
but would work for voice. The new OEM price is something like $150.00.
They're small, 2in x 4in x 1in. I was looking at them for a telemetry
priject, but the matching transmitter is not type accepted, which was a
problem for me, but not for Ham.

The model # is something like DM-3170 ??

I dont have the phone number but they're in Waseca, Minn.

Good luck

Sure, bring it along. Once the repeater has been brought up and is open,
it is held open by simple carrier squelch. If you hear a repeater in use,
just chip in, and be careful to avoid over-long pauses between transmissions.

>lowest I have seen one go is about 150 Mhz

Most of the B/K high band HT's cover 148 to 174MHz from the factory
and can be modified to cover down to 144MHz. Look at the suffix on
the radio's uP to tell:

/00 - can't be forced below 148MHz (oldest models).
/01 - internal resistor jumper extends coverage to 144MHz w/
keyboard programming.
/02 - can be programmed to 144MHz with dealer software only
(newest models).

However, the model you have was manufactured for the military in
their low band split. It should be prgrammable from 136 to 160MHz
without modification.

Dave,
No I dont, your post is the first I have heard of it. Although I am not
suprised to hear of it, I think 1 factory turns out all of these and just
puts anyone's name on it. Although ACE communications cant seem to get
their stuff through type acceptance at the Flunked Clown College.
I was going to buy an AOR 8000 at Dayton but thought I would wait and talk
to ACE. I talked to them last year and they said their 3800 would be
about $480. I called them when I got back in town and they still have not
recieved type acceptance. (might have some thing to do with fine they
got last year?). The Ham Station had the AOR 8000 for $ 570 now they are
$ 590. I sold my 1000xlt so I am with out a good hand held!

There are actually 3 major groups of 530's relative to this mod, in
order of mfg. date:

1) no green wire, but 800 capable

These you actually have to desolder the jumper the hard way

2) green wire, but 800 capable (like mine)

The ideal situation - just snip the wire, hit the buttons, and
you have 800-950MHz continuous RX coverage (and extended TX too)

3) green wire, no 800

These are of the most recent manufacture (since summer 94?)
after the more stringent ban on cellphone-band-capable receivers went
into effect. Apparently these radios cannot be modified to receive
anywhere in the 800-950 MHz range.

The only drawback on that is that your (ham) radio is not type accepted
by the FCC for the service you are using it in. Yeah...yeah....everyone
is doing it...NOT ME though. That makes your radio subject to confiscation
and you subject to stiff fines. But....it only happens to the other guy.

>sold it.

Duh. You're right. Brain fart. Now I remember the rest of the bit about
this rig -- red LED freq readout, kinda jumpy on the frequency tuning
because it didn't have the more modern "damping" on the shaft.

>By the third time it happened, the pattern had repeated itself enough for me
>to realize where the problem was - the heatsink for the finals was too small.

There was that, as I now recall, and if I'm recalling correctly, it was
using bipolar transistors on the output? ie, when things get hot in a
bipolar amp, there is that little thing called "thermal runaway..."

>I had an SB-102 (all tubes except the VFO) before the 104A, and it was much
>better equipment, IMHO. My only complaint at the time was the lack of
>receiver offset tuning.

Yea. I should have mentioned the following rigs which I also used in some
Field Day contests:

- Heathkit HW-101 -- An OK rig. Very economical at the time, but if you
were running close to band edges, you wanted to
be careful, because you only got a dial calibrated
in 5 kc increments.

- Heathkit SB-101, 102 -- I never used the '102, but I used the '101 plenty
at my elmer's place. Other than the lack of RIT,
it really worked quite well.

The HW-101, SB-101 and SB-102 were all "classic 6146 final"
style rigs.

>BTW, you're correct about the FT-101, it *is* a good rig. I'm still using the
>one I bought used about seven years ago. <g>

All I remember about the Ft-101 was that it seemed to be more rig than the
Kenwood TS-520 at the time, even without a digital freq readout. I liked
the CW handling of the rig a bit better.

>Don't forget that these these rigs don't include the WARC bands, and most
>don't have provisions for adding three new bands.

Goes without saying... ;-)

>Unless there's something unique about the rig, or you have a special use
>for it, rigs from the early 80's might be a better choice. For serious CW
>work, Ten-Tec seems to have an edge (full break-in that really works).

Ten-Tec rigs are the one 70's and 80's rigs that I've never used. And I'm a
CW fanatic. Folks: please fill me in on the plus and minus points of the
Ten-Tec line. I've heard enough CW ops praise these things to pop for a
used one...

>CAn any one tell me if a HT-600 can be modified to scan. I have 3 VHF and 1 UHF and would like have them scan. I know that the low band HT-600 scan. Why not VHF and UHF. Also are there any other mods. that can be done to these radios Thanks
>Keywords:
>
I have never heard of such a mod. You could design a circuit, basically
a counter, that would count up in binary, send its output to where the
bcd channel switch goes, and have the counter stop counting when the
squelch opens. I don't think the design would be that complicated, but the
best solution is to upgrade the radio to an MT1000 or HT1000. I purchased
an MT1000, which scans and has a priority channel.

If you wish to sell your existing radios, please contact me via e-mail.

If you or anybody knows of any mods for the radios, please post them.

I recently acquired a Heathkit SB-102 HF rig. The rig works great except that I can only get it to put out 50W on 40 meters novice band. Every where else, the rig puts out 100 watts. Any ideas of what might be wrong? As far as I can tell, I'm tuning it right. I DO get 100 watts on the other bands.

: I have an FT-2500M. It's much better than the Kenwood 221 I was using,
: but it still gets wiped out several places in downtown DC and at my
: home station. There are some paging transmitters about 1/4 mile from
: my house & they destroy everything on 2M unless I use an old Motorola
: radio with the helical resonators in the front end.

That sort of sums it up. I went shopping a few years ago for a
decent, clean TW4000. Last year, considering where to put it in my new
Disco', I wondered about one of the new jobs with remote front panels. I
made some measurements on some and gave up in disgust.
The TW4000 soldiers on.

The new radios have superb intermod performance, their adverts tell
us so.

But, terribly sorry, advertising people, I'm not going to buy
anything until the manufacturers get the intermod performance back to
"absolutely amazing", I'm afraid merely "superb" isn't good enough for
me!

We can still buy good radios, just not on the new market

have used:

Ten Tec Triton IV (540 analog, 544 digital) was a basic good performer,
100 watts solid state, SSB/CW, good QSK for CW, one 8 pole SSB filter with
audio filters for CW. Very light, but not small. Audio derived AGC
was a little annoying with strong CW signals, but that was the worst
problem it had. No WARC bands on these.
Very nice rig, came out around 78 or so? Can be had
pretty cheaply these days, I have seen them for under $300 and even lower
at times.

Ten Tec OMNI-D, series A, B and C. These were the deluxe versions of the
Triton IV, with more crystal filters in line, digital readout (from a
frequency counter) and other nice features like a spot switch. Larger
than the Triton. 160 meter sensitivity very poor by design. Audio
derived AGC for the CW audio filters was not so hot, but OK. QSK great.
100 watts out, solid state all the way. Very pretty rig, easy to use.
The C had WARC bands, but the others did not, though I believe they had
extra positions on the bandswitch and you could easily add crystals for WARC.
I see these go for under $400 at times, more when they are in nice
shape.

->[Why do extended TX mods?]
->
->- TX in the 430-440 range: Most HTs (for some reason) only come with
-> 440-449 enabled.
-Why not modify for TX in the whole 420-440 range, not just 430-440.

By default, most 440-capable radios only TX on 440-449.999. I needed
to add 430-440 (420-440 would also be fine, but, if I remember correctly,
there is no FM phone in the 420's) Unfortunately, many radio manufacturers
(Icom, at least on the 24AT, Yaesu on the FT530) only give two choices:
440-449.999, and whereever the PLL will lock (something like 420-460 or so).
Therefore, In order to transmit within the Ham bands, I need to do the
"out of band" TX mod.

I recently purchased a HTX-404 rig from Marymac down in Texas. For those of you not familiar with Marymac, they were a non-franchised Radio Shack who sold the same Radio Shack products at a discount... my HTX-404 cost me $209.00 whereas my local Shack had it for $250.00 ($229.95 + sales tax).

I recently called to place a second order and discovered that they are no longer in business! Does anyone know what happened to Marymac and if there might be another company like them that I can do business with?

Source record: 216906

I came into possession of a Yaesu FL7000 autotuner/amp which is about 9 years old. The autotuner section is powered by a lithium battery which is good for about 5 years, so saith the manual. The autotuner is currently slow and forgetful, not unlike its new owner, and its problem is probably a bum battery. There's nothing in the manual about how to replace this battery, although the schematic shows which microprocessor it's near. Is there anyone familiar with the FL-7000 and the technique for replacing the battery before I do an unskilled foray into its innards, and where a new battery can be purchased? Thanks for your help. 73 de Bill KB8USZ pruth@ocvaxa.cc.oberlin.edu 216-775-8285 X237 days, 216-775-7909 eve. & wkends.

From: Todd.Owen@ucsd.edu
Subject: Boosting power on wireless networking cards

If I purchases a set of wireless networking cards using the
5,750 MHz +/- spectrum, which is within the ham band, as a ham
am I allowed to boost the transmitters output power to achieve
greater distances between PCs?

This is similar to the question of boosting the power to 900MHz
spread spectrum telephones.

Is this practice prohibited by the FCC?

teeny speaker mics have teeny speakers, which aren't exactly "hi-fi"!

If you can handle the size, the larger speaker mics are much better
(and easier to operate).

Subject: Icom IC-W31A Modifications

Hi, If what they say is true, your w31 is basically the same radio as my
Z1A. If that is so, you should be able to access all frequencies between
50-990.990Mhz. To do this Press the light button+B+Func+then Power button.
If you have the same settings menus. Press Func+Set. Go to the Place menu,
and change it to 10 or 100. This will allow you to key in any freq stated
above. I havent figured out how to do the extended transmit yet. If you or
anyone else figures that out, let me know. By the way, the extended receive
is not very good outside the bands. But, it will do it.

I bought a new MFJ-949E a few weeks ago to go with my new Icom IC-701 HF
rig. Well, the rig is used but new to me. So far it seems to do a fairly
decent job. I live in an apartment and stuck a dipole (72 feet long) in
the attic. I can use the MFJ-949E to tune the antenna on 80, 40, 20 and
10 meters. Of course the antenna leaves a bit to be desired on 80 meters,
but it does tune it.

I also like the fact that the antenna switch is on the front and that it
has lighted cross-needles. No need to worry about SWR since I can readily
see the actual reflected and forward power at once.

because your site only held the posting for that long. Nearly all sites
"expire" postings after they get old. In your site's case, "old" is 2 or
three days.

If postings didn't expire, your newsserver's storage would rapidly fill and
nothing else would come in. You wouldn't like that!

I will be conducting Amateur Scientific studies of electro-magnetic
events in Western Siberia. I need ten good solid state(large but not

so heavy) receivers. These should have free space inside for the mounting of special detectors. I also need two good tube type receivers to be used in the test.

I also need a digital signal generator that covers from 50 to 100mhz or 100 to 150mhz in at least 1 mhz steps.

Date: 31 May 1995 19:35:53 GMT
From: jdonimi@nv2.uswnvg.com (Jeremy A. Donimirski)
Subject: YAESU FT-530 Power Connector

All you thrifty YAESU FT-530 owners, I have confirmed an alternate source of a power cord for the FT-530. It's made by PHILMORE and the part number is TC240. What you get for $2.95 is:

Molded DC plug 4 mm x 1.7 mm
Integral 6 foot mini "Zip cord"

I made up two special purpose power cords with these and both work PERFECTLY. I'm really thrilled. I even confirmed that these TC240 plugs fit SONY Discman players.

I use one to connect my FT-530 to an external 12 Volt battery for extended time use of my portable during parade communications (four long hours of operation at 5 Watts).

The other one is serving as an adapter cable to allow me to charge the battery from the top connector. It's such a pain to remove the soft case every time I need to charge the battery through the YAESU side connector. Now I just plug the YAESU wall cube charger, through my adapter, to the jack at the top of the radio. Did it last night and it charged it overnight.

Your biggest challenge may be to find a dealer of Philmore products. My parts came from Sparky Electronics in Fresno, CA. (209) 227-2986. I don't know if they deal via mail order or not.

Many thanks to a special friend in Fresno for alerting me to this find.

Now I know these rigs are just great the way they are ! I may get some people upset at the thought of changing originals but I am new to this equipment and don't want to miss out on anything ! Anyone have any neat mods for these ? Also let me take this time to thank all who helped in the purchase questions on the R390/R390A. As you can see I came up with a nice deal on a R390A (ok but but dead 11 & 25 mhz) and a spare for parts as well as a CV-157 SSB adapter minus the meters and a few tubes. The 157 had a number of problems but mostly minor. It now has one dead channel but I are working an that. I still have to get a 390 manual to look at the band problems but that should not be too bad. Fixing these are half the fun ! Thanks in advance for any reply. 73's N1DVE

I would suggest one of the older analog ten tec radios. The triton 4 and 5
(the 5 has a digi display) are excellent 5-banders with good audio, QSK, and
excellent filtering. They put out a good signal and run on 12 Vdc. The argosy
and argosy II are also fine rigs.

feel free to email me if you want more info.

>mods for these ?

The most popular mod is to remove the ceramic bypass capacitors on the
AC power line. This will make it more sensitive to hash on the power line
but will reduce your chances of getting killed. These capacitors invariably
become leaky over the years and the chassis starts floating at voltages that
you may find alarming.

Another popular mod is to replace the ballast tube with a resistor. Don't
do this. 'Nuff said.

There is a very good audio output section modification in a recent issue
of Electric Radio. The improvement in sound quality is astonishing. It
came out about a year ago.

Let me also point out that in standby mode, the voltages on the PTO tubes
are somewhat higher than they ought to be. Someone who could develop
a mod to remedy this would definitely be helpful.

> Also let me take this time to thank all who helped in

These are very fine units. The 390A is a real pain to work on, but is
a spectacular performer.

Greetings all,

Once again I would like to gather some information from the collective wisdom of the net. I am interested in upgrading the HF station. My financial window is in the $500 - $650 range. I'm interested in 80 - 10m inclusive. Coverage of 6m I guess would be optional as far as my current interests lie. Never tried it and I'd have to get permission from the on-site building inspector for another antenna. ;-) I'm interested in hearing opinions concerning what rigs in my price range would fit the bill. I'm primarily interested in a rig from one of the big 4 group Kenwood, Icom, Yaseu, and Ten Tec (obviously, we're talking used gear!). FYI, I'm currently using a Kenwood TS-520.

>help appreciated. Rick Crider <rickcrider@aol.com>

If it helps, I am using a Yaesu FT-301D HF transceiver. It will operate
on 10m-160m excluding the WARC bands. It has both upper and lower side
bands, and CW. The 301D has a digital freq readout and is fully
transistorized. I really like this radio, but would also like to be able
to work the WARC bands.

I don't know if this is enough info for you, but I am doing this from
work and don't have any other info with me.

Hope this helps..

: instructions on how to wire this kind of set up all they show is handy
: talkies and 8 pin mikes seems like they should have shown at least on
: example of this kind of setup.

Well, I have my manual here from the KPC-3. It says to make the cable from
your radio to the KPC as follows: Use these pins on the DB-9 connector
to the appropriate pins on your radio:

DB-9 pin Radio pin

1 Microphone input
3 PTT or STBY connection on radio
5 External speaker jack of radio
6 Ground of your radio

This plus your manual for the TS768a should tell you how to wire it up.
This is on page G7 of my Getting Started manual (version 5.0).

Is the MFJ "econo-keyer II" especially prone to RF problems? Mine sometimes gets "stuck" and defaults to a very slow speed. To reset it, I have to power it down and start it back up. Very inconvenient during a QSO. Any suggestions via E-mail would be appreciated, as I do not get on this group very often. Thanks and 73,

I am currently looking to purchase a pre-owned VHF-Hi portable thats in near perfect condition, thus fully operational. I would prefer a Motorola or Bendix King model. Would only need 2 channel capability at minimum. Must have private line tone feature. If you have a radio, along with good battery and accessories that you feel can meet my needs...please feel free to contact me. Thanks.

Does anyone know of a source for the plastic battery latch on a FT-530. This is the spring load latch you push towards the top of the radio to release and remove the battery.

Mine broke, and yaesu says for all other models you can buy just the latch, which is about a 25 cent part, but for the ft-530, you have to buy the entire base of the battery, which costs almost $9 with shipping... any ideas???

all comments would be welcome.

4633. IC-735: Noisy blower motor

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-01 00:00:00 UTC
From: phb@syseng1.melpar.esys.com
Message-ID: <phb.802033342@melpar>
Source record: 216920

I have been bothered twice by the blower motor in my Icom IC-735 becoming excessively noisy. Both times I've gone in and carefully lubricated the shaft of the squirrel-cage fan and that has temporarily cured the problem, but it comes back after a while (probably after the oil dries up; I don't use much).

Has anyone tried graphite or silicon, or have a recommendation for a longer-lasting lubricant? I hate taking the rig apart periodically for such a mundane reason, as a fair amount of disassembly is required to get at the blower.

4634. Re: Shielding radios from computer-generated RFI

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-01 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <D9Iq6I.Itn@avalon.chinalake.navy.mil>
Source record: 216921

Assume that the computer stuff is in metal cases and not plastic. If not get the computer stuff in metal cases first.

Three things to try:

1. Make shure that you have a good RF ground (long ground rod and low inductance connection) for the radio gear. Now connrct the case(s) of the computer stuff to the RF ground with low impedance path. This should solve a lot of problems. Use of a ground strip arangement is recommended.

2. Make shure that all of the cableing to printers, monitors, TNC's disk drives ... is 100% shielded and have metal hoods. Most cheap cables with plastic hoods (formed hoods) are not shielded at all. TNC's are notorious for RF noise on the cable.

3. Try some snap on ferrite beads on the power cables, monitor connection cables, printer cables, RS-232 cables ...

The curtain you are thinking about will be expensive and awkward to use.

The ARRL interfearnace book may also give you some additional things to try.

>>Thanks for reading and for a reply, if you have one.

Probably the BEST buy in the used market is Drake equipment, like the
TR4* transciever or the R-4*/T-4X* separates. I've seen clean examples
go for around $300.00. They're great on CW and SSB and the separates
cover 160 metres as well. Also they come with pretty decent manuals and
are fairly easy to service.

Good luck!

Kenwood didn't think to include a plug with the rig. As Radio
Shack doesn't carry these, does anyone know of a mail-order source
for these 6-pin mini-DIN plugs in small quantities? I know that
Kenwood offers a cable assembly with the plug installed, but it's a
bit pricey. Also, I see the plugs listed in a recent catalog from
Newark electronics, but they have $25 minimum order requirements as
> well as a credit card surcharge.
> Thanks, in advance, for any assistance.

Try JDR Microelectronics - I have bought mini-DIN plugs from them
in the past. I don't have a catalog handy now so I can't check
their min order for you, but no credit card surcharges.

Another source might be a local computer store. mini-DIN plugs
were used on IBM PS-2 keyboards, but unfortunately my memory does
not yield whether they were 5 pin or 6 pins.

I hadn't really thought about it, but I wouldn't mind upgrading mine. My wife just got the TH-79. I have many features on my TH-78 that Kenwood left out on the TH-79 which I would miss, but it would be nice for us to have the same radios.

I paid for all of the modifications (performed by a qualified technician at Communication Headquarters in Wilmington, NC) so I need to ask for a little more than for the factory model.

E-mail me and I can tell you all about the rig and assure you that it is a good dual bander. Brad / KO6LB / snell@community.net

>--
> John Meaker - kr4ah

John,
I own a Mazda (really a Ford Ranger with a Mazda Tailgate). I just
installed an ICOM 2700H with a remote faceplate. The radio is
working fine. Have not noticed any spurs or rfi. I did call Mazda
and Ford up. They recommended not to run any antenna cable over
or near the main computer. (In my truck it seems to be about in the
middle of the dash board up real high near the fire wall).
They did have reports of strange things happening with some of the displays
when running high power radios (ie digital clocks, gas gauge).
They say the main cause was poor antenna installations but recommended
to use radios with less than 10 watts.

I run 50 watts on 2 Meters and 440 with no problem at all. It sounds like
it you do a good job with grounding and adjusting the SWR you should be
fine.

Good Luck,
Peter
WB1DWK

PS
The truck is a 1994 Mazda Extended Cab 4x4 with a V6 4 Litre. I mounted
the radio in the cargo net and the front faceplate under the dash. I
use the InfraRed Wireless Microphone and it works like a champ!

You might want to pick up a copy of the ARRL QST magazine.
It just became available at newstands. There are a bunch
of advertisements concerning books and exam aids.

I would also recommend to get involved with a local Ham Radio
Club. You will be surprised at the number of hams that will
be willing to help you out.

If you can't find a copy of QST let me know and I'll send you
one.

Good Luck and let us know how you make out.

Message-ID: <3qjhbv$20i@newsbf02.news.aol.com>
Source record: 216931

Hello all,

I'm not a radio wiz but I need a transmitter and receiver to handle voice data.

Specs include:
- must be LOW cost. (Preferrably under $300)
- must cary continuous voice data
- max range would be 1/2 mile
- the lower the power requirement the better
- must be a clean signal with NO Interference!

For my application, a walkie-talkie would likely work but wouldn't be reliable. Also, the tranmitter must be separate from the receiver.

Does any one out there have any advice?

Thanks in advance!

Eric D.

I called and they said they sell replacement parts for existing systems. You would need a specific part number or system number to place an order.

I asked for a catalog to do this, and the (very nice) receptionist took my info and said I would recieve one shortly.

Hopes this helps others out, and thanks for the tip Glenn!

4654. Kenwood repair advice?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-02 00:00:00 UTC
From: dao@mrspock.mt.att.com
Message-ID: <D9K2Cy.8Mr@nntpa.cb.att.com>
Source record: 216851

Need a recommendation for a competent, reliable, efficient
repair center for Kenwood. My TM-241 was nailed by lightning and
repairs will probably be extensive/expensive. Was not happy with
Kenwood's suggestion for local service. I'm in NJ but will ship
anywhere if the service is topnotch. Thanks.

Source record: 216855

Now I know these rigs are just great the way they are ! I may get some people upset at the thought of changing originals but I am new to this equipment and don't want to miss out on anything ! Anyone have any neat mods for these ? Also let me take this time to thank all who helped in the purchase questions on the R390/R390A. As you can see I came up with a nice deal on a R390A (ok but but dead 11 & 25 mhz) and a spare for parts as well as a CV-157 SSB adapter minus the meters and a few tubes. The 157 had a number of problems but mostly minor. It now has one dead channel but I are working an that. I still have to get a 390 manual to look at the band problems but that should not be too bad. Fixing these are half the fun ! Thanks in advance for any reply. 73's N1DVE

4666. Re: Ford Ranger Installation Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-02 00:00:00 UTC
From: Earl Landry <6514266@mcimail.com>
Message-ID: <3qo1m1$746@hermes.dna.mci.com>
Source record: 216863

I installed a Kenwood 742 with 6 meter module and a Kenwood TS-50 in my 1990 Ford Ranger with the 2.2 Liter 4. No problems with the radios interfering with the truck electronics. Almost no noise in either radio caused by the engine. I routed the power cables from the battery, in front of the radiator, down the left-hand side of engine compartment and through a grommet into the cab. The antenna leads went directly out the back of the cab.

Good Luck,

Earl Landry, AB5VM

The range you got is according to the limits programmed in the
new D version. The range now reflects the actual lock range of the VCO.

"This" isn't a list, it's a Usenet newsgroup. Nobody maintains it. If something disappeared from your local system, it probably expired. Ask your sysop what the expiry times are set to.

Of course, if you posted a for sale ad in a group that doesn't want for sale ads, your ad may have been cancelled. This group, rec.radio.amateur.equipment is NOT for buying and selling equipment - that belongs in rec.radio.swap.

Hello.

I am looking for an ICOM IC-2AT 2m HT ("The Brick") in good, working condition.

If there is one available, I'd prefer the seller to be located somewhere in the Greater-Boston area, so I can try the radio myself prior to possible purchase.

If anyone is selling, or knows of a store which may have some in stock (probably used), please let me know.

Thanks much!

The following equipment for sale:

HF Rig, Kenwood TS-440S with antenna tuner
and matching PS-50 Power Supply. Radio does
have some minor scratches, excellent working
condition except FM section is out. $895.00

Dual Bander, Icom TM-732A 2m/70cm. This
radio is almost new. Used very little, never
mounted. 50 watts on 2 meters, 35 watts on
70 cm. Cross band repeat. Includes duplexer
and optional tone unit. $495.00

Handy Talkie, Kenwood u2at (micro 2 AT).
This is a small one, includes one battery and
fast charger. My wife used this radio, it
is in good condition. $175.00

Telex/Hy-Gain Tribander TH5/MK2 beam. $395.00

Hy-Gain Ham IV Rotor $240.00

Cushcraft AR-270 Dual Band 2m/70cm. $45.00

I have manuals on all equipment, except the rotor. You pay shipping
costs at these prices. Antennas and rotor currently on tower and will
be taken down in the next 3 weeks, or sooner. If interested or if you
have questions contact Tom Holland N5JKN at thomas.p.holland@jci.com

Subject: FS PRC25 30-75Mhz

For Sale:
U.S. Millitary Vietnam war era PRC25 FM radio, as seen lugged about in
many war movies.

Includes handset, whip antenna and homebrew 13.8V battery eliminator so
rig can be powered from cigarette lighter.

The radio covers 30-75MHz TX/RX with about one watt output.
Asking price is $230.

This big, heavy, ugly and green radio can survive drop test that would
leave modern HT's in chunks!

FOR info email me at jgg@iglou.com

Thanks,
Jim KQ4EL

Subject: Re: Rigs of the Seventies

I saw that Ten Tec was mentioned, but not details, here is what I
have used:

Ten Tec Triton IV (540 analog, 544 digital) was a basic good performer,
100 watts solid state, SSB/CW, good QSK for CW, one 8 pole SSB filter with
audio filters for CW. Very light, but not small. Audio derived AGC
was a little annoying with strong CW signals, but that was the worst
problem it had. No WARC bands on these.
Very nice rig, came out around 78 or so? Can be had
pretty cheaply these days, I have seen them for under $300 and even lower
at times.

Ten Tec OMNI-D, series A, B and C. These were the deluxe versions of the
Triton IV, with more crystal filters in line, digital readout (from a
frequency counter) and other nice features like a spot switch. Larger
than the Triton. 160 meter sensitivity very poor by design. Audio
derived AGC for the CW audio filters was not so hot, but OK. QSK great.
100 watts out, solid state all the way. Very pretty rig, easy to use.
The C had WARC bands, but the others did not, though I believe they had
extra positions on the bandswitch and you could easily add crystals for WARC.
I see these go for under $400 at times, more when they are in nice
shape.

>Yaesu $80 remote control mic.

It depends on what kind of Motorola mic. Most of the mobile mics require
DC on the mic line to power the transistor amplifier that is built into
the microphone. Some of the Motorola HT mics also require DC on the
audio line, some have it isolated from the mic line, some don't require
any power at all. What kind of mic do you have?

Hi, I have the following for sale:

Swan Cygnet 270B Transceiver
- The radio works fine, but it needs some tubes replaced to bring
it back up to full output power. Includes manual and hand mic.

Heathkit HM-2140 dual HF wattmeter
- Includes manual and AC adapter.

10-mtr. dipole antenna (homebrew, less end connector)

Misc. amateur radio magazines (73, CQ, etc.) and test boooks.

$250 or best offer gets it. I would rather like to sell the whole thing
than rather piece it out. I would be extremely interested in trading
for a Atari Jaguar, or a Commodore 128D. If you have any questions, feel
free to e-mail me. Thanks for looking!

Instead of hooking up the audio input (pin 5 (?) on the DB-9) to
your VHF/UHF radio, hook it up to your HF rig. The KPC-3 doesn't care
where the signal comes from, it just demodulates the audio signal. Of
course, _transmitting_ packet on the HF bands is a no-no.

I have one for about a year now. Works quite well, however the knob type tuning is not well designed and uncertain in operation. It skips over the channels or sometimes "sticks" to a channel when you turn it. Also I have messed up the memory by starting the car with the power on...scary looked like I blew the unit out however, I was able to reboot. This lost all the saved memory channels and PL's. May be fixed on the 2500 unit.

I use a pack made from 6 lead acid cells about the size of D batteries
and if is about 2.5 A/h will run an HT for about 12 to 14 hours
intermittent use using a battery saver mode and running 5 watts. got it
at a hamfest for $10. Also have a 26 A/h one that is much larger for
running the HF rig on.
Also use the little one to run my QRP rig in the shack and at the club
picnic and it will run a 750 mw rig for a really really long time (never
ran out!)

I already posted this on rec.radio.swap but I thought I'd try here, too.

I'm looking for a Schurr "wabbler" iambic keyer and a "mobil" straight key. Anyone know what they're going for? Anybody got one for sale? Are the Jones and Kent keys as good (I think they're cheaper, anyway).

I'm getting back into CW after about an 8 year hiatus. I have a Bencher that I never liked due to its mushiness and cheap construction (plating's coming off!).

Thanks! E-mail to geoffs@onr.com

I believe you will not be prosecuted as a ham for modifying your HT,
but using a modified transmitter on a frequency where only type-accepted
transmitters is permitted is a different matter, even if you are
separately licensed to use that frequency. As I see it, you would
be taking you chances with getting caught. You could use your HT
to receive only with no violation of the rules, but transmitting
is a different thing.

Don

4714. IC900, Interface A, not working

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-04 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <3qsri6$qa8@mrnews.mro.dec.com>
Source record: 216809

Hello,

My IC-900 stopped working. By substitution I have narrowed it down to
Interface A.
With power on the remote display is blank and after a few seconds I start
to hear some pops from the speaker followed by very loud static/noise.
Without a schematic its hard to identify surface mount componets.

I found a surface mount componet marked CK 64. It connects
to IC21 which the block diagram calls a 5volt reg. The block diagram has
a 8volt regulator (Q11,D2) feeding the 5volt regulator. I am guessing
that CK 64 is Q11. It has 4 leads with to connected together. I have determined
this to be a NPN tranistor.
About an inch away there is another CK 64 that looks like its connected
to several tranistors that also looked like there connected to the fiber
optic connector. This CK 64 appears to have a hair-line crack. Using my
meter in the diode check position has determined not to give the same
results as the CK 64.

Can someone confirm what CK 64 is? Does anyone have a schematic for
Interface A they could fax me?
Does ICOM have a trouble-shooting hotline?

thanks,
Ken

Subject: Question about software to prepare for the General Licence

>>I have a novice licence and would like to know if there is any
>>software which is designed to help one to prepare for the technician
>>and general exams...

The BEST I could find when I was searching were these offerings:

Novice/Technician Class Manager
General Class Manager
Advanced Class Manager
Extra Class Manager

FEATURES:

- Simple, intuitive system for preparing for Ham License
Examinations
- Perfect tool for Volunteer Examiners for creating tests
- Manages entire question pool
- Begin reviewing at any question
- Review questions sequentially or randomly
- Shuffle answers for each question if desired
- Take a test from randomly chosen questions (within the
guidelines of the FCC testing criteria)
- Full set of options for customizing tests, including a Test
Design Screen
- Print complete tests, along with answer sheets and score key
- Save tests to disk for later use
- Study assist screen tells you what areas you need to study after
taking a test
- Pop-up on-screen calculator
- Automatically "remove" a question from the "question card deck"
when answered correctly, if desired
- Manually remove any question from the "deck" at any time
- Reinsert into the "deck" any previously removed question
- Start review all over by putting all "cards" back into the deck
- Show answers always or only after an attempt at the answer has
been made
- Saves option settings, deck, and last question number to disk to
"pick up where you left off"
- Print any part of the question pool

Subject: Re: Radio Shack PRS-100 - Any Good?

>Is the prs-100 uhf model a good buy for non-licensed folks?

>>This radio requires an FCC license (GMRS) for legal operation. No
>>test, just a $$ fee.

NO current Radio Shack GMRS HT is programmable for CTCSS tones - which are used to access repeaters. The current Radio Shack GMRS HTs are worthless for serious GMRS work. They merely offer short-distance work on the interstitials (simplex) GMRS frequencies. (And don't even offer 462.675 - the nationally-recognized Emergency frequency).

Maxon makes the 210+3 HT - for a little over 200. bucks - which is the model of choice right now for serious GMRS work - when price and features are all considered for an HT. 10 channels (1-7 are hard-coded interstitials, Ch. 8 is fixed at 462.675 and you set whatever CTCSS tone you want, and Chs. 9 and 10 are User-programmable to about any GMRS frequency).

Of course, the Icom IC-U16 is available for 2.5X the cost of the Maxon!

4724. Re: "Superb" intermod rejection

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-04 00:00:00 UTC
From: tvr@cnmat.CNMAT.Berkeley.EDU
Message-ID: <TVR.95Jun4014312@cnmat.CNMAT.Berkeley.EDU>
Source record: 216891

Well, I can see my message from yesterday sure got screwed up! What I was trying to say is that I have a Standard C168A 2-m HT. It has no intermod problems with an antenna as good as an AEA HotRod; but when I hook it up to an external antenna such as a roof mounted 1/4 wave ground plane, or a trunk mounted mobile antenna, intermod is terrible! However, as I said >> once before, the intermod is eliminated when I hook up the HT to a Radio >> Shack 2m amp.

Assuming it's a late-model RS 2m amp, that's probably because it has a helical reasonator in its pre-amp curcuitry, so your receive range is comparable to your transmit range. As you noticed, it also helps in high-RF environment. Yes, weather and other services will be attenuated, but they're strong anyway in most parts of the country, and if not, you can just bypass it when you need weather info in an adverse environment.

Maybe a future QST article could include such a device in a pre-amp which likewise does T/R switching automatically. <hint> <hint> If you want to do your own, DIGIKEY has them in their catalog, i think they're in the $20-30 range -- not cheap but worth it.

Message-ID: <TVR.95Jun4015349@cnmat.CNMAT.Berkeley.EDU>
Source record: 216892

If I purchases a set of wireless networking cards using the
5,750 MHz +/- spectrum, which is within the ham band, as a ham
am I allowed to boost the transmitters output power to achieve
greater distances between PCs?

If you're running spread-spectrum under Part 97, it currently has to use
one of the algorithnms recognized by the FCC for amateur equipment. We
are working to get the restriction lifted, but that probably won't happen
very soon. So, unless someone can tell you definitively that it is using
such a spreading-sequence, you'd better not modify a Part 15 device for
more power. For more information on the basics of spread spectrum (and
some of the restrictions we face), please see a reasonably current ARRL
handbook.

I'll be moving to an apartment where I won't be able to use this
system. I'd like to sell it so I won't have to transport it and
then sell it.

For Sale:

Ten Tec Omni V-562

~ 1140 - Circuit breaker
~ 288 - SSB filter
~ 218 - SSB filter
~ 257 - Voice module
~ 259 - ALC
~ 256 - FM board
~ 282 - 250 Hz CW filter

I bought this rig new in 1992 for $2500 with the above accessories.
This radio has not been on the air for more than 5 hours and has
lived in a smoke free environment.
Along with the Omni V, I will include:

* 25 amp power supply
* 2 antenna systems (10 meter indoor, 10-75 meter indoor/mobile)
* Low bypass filter
* D104 microphone (non amplified)
* Ten Tec 253 Automatic antenna coupler/tuner

This is a complete station and all can be had for only $2500 (firm).
I still have this station set up, but will be torn down soon to prepare
for the move. Contact me for inspection.

Please reply direct to:
howie@intgp1.att.com as I don't always read this news group.

: at this point. Thank you & 73s. Any hints appreciated.
: KE6UKF

Helene,
Assuming you have the correct offset set for the repeater your
using and have the tone turned on if it requires one they should be
hearing you. When you key up the mic are you getting a courtesy beep? If
not your not hitting the machine. Check to make sure your offset is set
properly (+ or -) and check if the repeater uses a tone and be sure to
turn it on to the right tone. If you want to join a QSO just say your
call in between the QSO. IF you want to try contacting someone say "call
please" and you should get the go ahead from one of the people having the
QSO. When your finished makeing your call (tell your contact to QSY to
another freq so the original folks can continue) thank the original folks
that gave you the break and go clear. Don't get nervous that no one wants
to talk to you! I thought the same thing at first until I realised that
my HTX-202 wasn't set properly. That happens with newbees! It's no big
deal.

>Chris KE6EHE

I have the Quantum battery. It is about the size of a large HT. Comes
with a carrying strap that you can throw over your shoulder and a belt clip. I've
used my for a weekend and it still have 50% of it's capacity. The nice
thing about it, is the three LEDs that give you an idea about the capacity of
the battery. I've seen
a few others batteries that are a little smaller that you can mount
on your belt. Not sure of the name but they seem pretty good also.

PS
Quantum has made batteries for the Photography industry for years. They
have an excellent reputation.

Do be aware that the R-390A and the R-390 have very different schematics. I do have a set of hacks in mine, including a beam deflection tube SSB/CW detector, a modified noise limiter, hang agc, and "0" to 500KHz reception (of a sort.) Alas, I do not have them written up in a form for posting. Howsosomeever, if you are clever enough it is easy to generate these sorts of hacks for yourself with ideas from the ARRL Handbook and old QSTs. You can build the schematic easily enough by tracing the physical sircuitry yourself. That is how I did it until I got my manual. (I even discovered that the ground "bus" input side of the mechanical filters was never grounded to the chassis. Once I grounded it things suddenly came alive and worked the way I expected. I bet that is why I got this beautiful thing surplus looking so clean. - Um this was back in about '69 or so.) Treat your baby with adequate respect and be careful with the mods. It will then do very well for you.

Mumble - 11MHz and 25MHz dead? Schematics are too hard to get at the moment but that sounds like you either need a dose of contact cleaner or you have at least one more band out.... 0.5 - 8MHz the receiver is triple conversion to a variable 17-25MHz first IF. Nope - your two "out" frequencies are not in that overlap band. Check the crystal sockets in the upper oven. These crystals run 11-34Mhz in 1MHz steps for conversion of a 1MHz band to the 3 to 2Mhz range. (Note the inversion.) You probably have the 14Mhz and 28MHz crystals dead or lose or needing pins cleaned. (It IS possible that 430A and 431E are sick, too. Um, I went and got the schematics anyway...) The actual crystal frequencies are half the injection frequencies in some cases. So look for a bad Y409 at 14MHz. That covers both bad bands.)

No - I won't sell my manual on a bet. Nor do I want to pull it apart for copying. There used to be services that sold copies, though. You want

4732. Re: HF-Transceiver JRC JST-245

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-05 00:00:00 UTC
From: wa8msf@aol.com
Message-ID: <3qutlt$gfk@newsbf02.news.aol.com>
Source record: 216819

Hi Manfred!

I bought a JRC JST-245 back in November '94 when they first became available in the U.S.. I use it mainly for 6 meters since I have an FT-1000D that I use on HF.

I find the receiver to be good and strong on all the bands on which I have listened. The noise blanker works well on automobile ignition noise and some short pulse-duration (triac?) types of AC noise. It doesn't do well on the type of power mains noise that I encounter here on 50 MHz.

I get good audio reports with the transmitter, although I am using a Yaesu hand mike since the radio came without a microphone. The Yaesu MH-1bb plugs right in and the UP/DOWN buttons even work correctly.

The built-in antenna tuner tunes all the weird loads that the FT-1000D tuner can, but the SWR meter is in the line BETWEEN the tuner and antenna. This means one cannot see how well the tuner matches the load except for a "beep" that announces the tuner has found an acceptable match. The Yeasu tuners in any model that I have used measure the SWR as seen by the output stage and one is able to watch the process "zero-in" on a low SWR.

The receiver AGC is good and is a night-and-day improvement over the JST-135 which I had years ago and got rid of because of terrible popping on strong signal attack. The AGC in the JST-245 is the equal of my FT-1000/990/890 rigs and the audio quality is better than all but the FT-1000, which is abouty equal, but slightly different in character.

The absolute best part about the receiver, apart from it's execellent dynamic range, is that it has NO WIDE-BAND HISS that plagues almost all modern receivers.

I don't know what these things cost in Deutchland, but I think the '245 is a good buy compared to what else is available, and I am very satisfied with mine.

BTW, I used to work as an engineer for R. L. Drake in the early '70s and have been around radios for some time. A friend of mine who is still with them as a V.P. stopped by my shack to give the receiver a listen and then promptly ordered one for himself. I talked to him on 50 MHz and on 75 meters a few nights ago to check out his new purchase and he indicated that he too was pleased with his decision to buy a '245. We are both receiver nuts, but he likes the MOSFET finals for clean transmit, plus it will drive and L-4B to good output levels. We both use a pair of 3-500Zs on 6 meters using Drake parts as a starting point.

If you have any questions in detail, please email me or post to the group.

4733. HELP RE: COLLINS 30L-1

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-05 00:00:00 UTC
From: af104@detroit.freenet.org
Message-ID: <3qv2mo$lel@detroit.freenet.org>
Source record: 216820

I have low output with a 30L-1.

Spec is 600 ma at 1,600 VDC fully loaded, 1,800 VDC no load.

811A's check out fine, but Plate voltage drops to about
1,250 VDC at 600 ma. No load voltage is fine.

Tuned input at less than 3:1 to driving TS940.

Suggestions appreciated.

Thanks.

I am in need of a relay, RL-1 for my Kenwood TS 520-S. I tried East Coast Parts but they say it is no longer available. I have written to Kenwood, but I thought maybe I can get some extra help from someone in this group who may have had to deal with this problem.

By the way is RL-2 the same type as RL-1 in this rig?

Many thanks ahead of time.

>
>

Hello Greg,
I'm from Italy and I don't know the orography of the DEATH VALLEY,
but in any case first of all It depends how far you want to communicate, if
there are high mountains to jump etc. In that worst case an mobile HF
system is the best solution, configured with a mobile vertical ant., with
an adequate automatic antenna tuner, here in Italy is quite common a
system from ICOM, IC707 (HF RTX) and a mobile wide band antenna 2.5 meter
long from ICOM with a specific automatic ant. tuner , if I'm not wrong is
something as AT-2 or AT-3. Then I don't know how are the regulation in
the country where you are planning to use this system, about frequency
management but in the case that you are "free" around 6.6 MHz is a good
compromise. On the base station the system could be quite the same but you
can substitute the mobile antenna with a marine wide band vertical
antenna. The RTX could be the same, because in the case that the base
station fail you can get a RTX from a vehicular station. Then is the RTXs
are the same is good from the point of view of the operators, that usually
are not experts. In the case that the orography is a flat land and the
area that you have to cover is quite small (less then 50 Km if it is really
flat), a VHF FM system is good enough. You can increase a little bit the
distance is you consider vehicular stations with a 5/8 lambda ant. and a
base station with a high gain vertical dipole (collinear). Speaking again
about HF antennas you can save a little bit of money if your system use
some fix frequencies bands (ex 4 and 6 MHz or 6 and 8 etc) because in
that case you can use dipoles, and cheap mobile antennas instead of
vertical wide band antennas.

that's all I think, all the best, and let me know if something in unclear

While I personally Love my Drake equipment I would not recommend it for
a beginner. The finals are sweep tubes, a beginner would be better with
a pair of 6146's much more forgiving and available. The Drakes also are
difficult to use, the sideband setup, backward reading dials etc.

While I am NOT a Yaseu fan, I would recommend an FT-101E as a first rig,
with a Kenwood 520 as a second alternative.

I own a pair of Maxon's GMRS 210+3 and really like them a lot. The GMRS 210+3 does not have many features as the Ham's HT such as lighted keypad, alphanumeric display, a five-watt Nicad battery (I heard that Maxon is working on a four-watt Nicad). The repeater access ability for the GMRS 210+3 is limited to the availability of your local area (you have to know the Tx and Rx frequency tones for a repeater). The GMRS license fee is $35 for five years (I heard the fee may have been increased though). The PRS-100 is a bit smaller with two preset frequencies and is not repeater accessible.

I am looking for an FFT processor chip.

I know of one chip, the TRW TMC2310, from the 1991 TRW LSI Products Databook.

This chip performs up to 1024 point FFTs and uses external memory for array storage. I would like to find a chip that will do an 8K FFT with internal array storage.

Has anyone heard of such a chip, or at least other manufacturers that make chips similar to the TMC2310?

Thanks

"J.Swenson" <jswenson@jswenson.hqsl.stratus.com> is looking for
mods for the Collins R390A that he recently acquired.

One place to look for modifications to the R390 is in back
issues of CQ magazine. One thing that can be said about
the magazine is that it did cover surplus equipment well.
Of the ham magazines, it is the one that I would look
to for stuff about surplus collins receivers. I can't be
bothered searching for specific articles, but one name to
look for is Paul Lee, who did write a number of articles
about Collins general coverage receivers, and I bet one
of them was about the R390. A common mod was to add a
product detector to the receiver.

If you can get access to back issues, either at a library
or a ham club or just someone locally with a good collection,
then you shouldn't have problems looking through the annual
index in the December issues to find articles. I'm thinking
mainly the sixties, here. If you don't have access, suggesting
certain articles won't help much, though it would be nice to
discover that CQ still made photocopies of old articles available.

4747. Tandy HTX-202 Compliments

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-05 00:00:00 UTC
From: DLSwank@aol.COM
Message-ID: <950605155819_87171880@aol.com>
Source record: 216834

Hi. Recently got a RS HTX202 to replace a pair of stolen Icoms. The Tandy is an excellent replacement, will get another next time they go on sale and I have the bux. A short tech-note:

Our Route 128 goes past Bear Hill, A/K/A 'Intermod Alley' by the locals. About 200 yards away, three towers full of VHF, UHF, Paging, Cell, and who knows what else, including four major microwave routes. I think it has half of the repeaters in West Metro Boston. I counted 26 VHF antennas a few years ago. Tune in a weaker repeater, put on a roof antenna, if you can drive by there and not get really hammered, the radio is OK. The HTX202 runs fine while listening to Derry, NH, about 40 air miles away. I can do without exotic bells and whistles, but I live less than one mile away from that wretched Bear Hill. It's also nice that it takes Icom accessories.

Also like rail travel and listening to train comms up at 161 MHz. Can recommend the R/S PRO-43 for a good scanner with a rugged front end. (Actually, it has 3 frontends, LO/HI/UHF. Ain't SMD circuits wonderful!) Good sens., and it passes the test above. It's tough on batts when running the scanner, but on single freq. is about as good as the 202 with no "save".

A favorite accessory: Two BNC elbow connectors for the duck antenna. (Lets you fold it down so it doesn't poke your ribs and armpit.) I suppose theoretically it affects the TX tuning, but have never noticed any real difference.

Thanx for all the good notes, now and in future.

>acknowledged? I know all of this sounds incredibly stupid--just frustrated
>at this point. Thank you & 73s. Any hints appreciated.
>KE6UKF
First, are you getting into the repeater? For example, after you finish giving your call, do you hear the courtesy tone. If you don't hear the courtesy tone (and, assuming that the repeater has a courtesy tone), they you probably didn't key the repeater. If this is the case, then check the offset, PL-tones, etc., and if you still fail to key the machine, you might need a better antenna, better (higher) location, or possibly more power.

Next, you might try calling one of the stations you just heard sign. Hams are a fairly friendly bunch. However, they may not give you a call just because they hear your call-sign, though they almost always respond to someone calling them. Try calling them (e.g., WA4QAL, this is KE6UKF).

Finally, most 2m contacts seem to be made on repeaters, although some of the more enjoyable kewsos (QSOs) I've had have been on simplex. 146.52 MHz is the national simplex calling frequency (The tradition is that you put a call out on 146.52 MHz and when you find someone to chat with, you move off to an adjacent simplex frequency to free up the calling frequency, although short QSOs on 146.52 probably won't hurt too much).

You may want to consider joining a club which sponsors a local repeater. Not only does this help support the repeater, but it's a good way to get to know some of the local hams, who can often offer hints to help you out. Also, you may wish to investigate some of the publications that the ARRL (Amateur Radio Relay League, 225 Main Street, Newington, CT) publishes.

Sounds to me like the power supply electrolytics have dried up. I would either check them with a cap tester, or replace them on general principle if they're the original caps.

I borrowed a 202 from a friend shortly after getting my licence. Later I bought an Icom W2A (dual band) and then I could do some real comparing. Besides the "weaker" front-end I have to live with on the W2A to get the nice wide-recieve capabilities (as you and others have mentioned), I really liked the audio quality of the 202. They used a bigger speaker with a little more robust audio amp and made it sound almost like a Motorola. Amazing what you can do given enough real-estate to work in, eh?

Don't knock it 'till you hear it.

I'm considering the purchase of a 2m amp for my car.

I'm looking at RF Concepts, RS, among others.

What are comments on the RS amp? Anyone use it?

I'd like to hear any horror/success stories.

Some specs are .5 - 5 watts in, 30 watts out.

Thanks.

The Yaesu FT-101E, which I still use, also has sweep tubes. Maybe one of the
early solid state rigs (Icom) would be a better choice.

Message-ID: <3r1o0f$3ss@clarknet.clark.net>
Source record: 216753

Greetings:

I have a used Kenwood TM-231A, which has worked fine
for the last 4 years. The other day when I turned on the
rig, and tried to talk on the local repeater the rig just
beeped at me, it didn't transmit. After some fooling
around, I discovered that the rig will transmit in simplex
mode but not in either the + or - offset. I hope that
this may just be a configuration problem, but the problem
is that I do not have a manual for the rig. I would appreciate
any help in tracking this problem down. Thanks in advance.

In the May and June issues of POPULAR COMMUNICATIONS magazine, an ad appeared for the new book on how to read and interpret all the basic weather charts. Since then, there have been a lot or orders and inquiries, so to summarize, here's the scoop on this book:
It is entitled, "WEATHER MAPS" and is written for non-meteorologists who get or plan to receive weather maps but have no reference on how to read and interpret the surface and upper air charts. The book explains the charts and is easy to understand. The cost is $29 which includes shipping, by check or money order from CHASTON SCIENTIFIC, INC.; P.O. BOX 758; KEARNEY, MO 64060.

Source record: 216757

Dan,

You might find out if it's covered under your homeowner's insurance.
If it is and you can get a letter from Kenwood they don't want to fix it
or it's totaled you might get a replacement radio for the deductable.

I have received great phone support from Kenwood but in your case I
think I would want the factory to fix it.

You might want to make sure you have surge suppressors on anything
electronic in your house. Microwave, TV, VCR etc.

I assume you are using 110VAC. It is possible that the AC voltage
is sagging too much. You may need to put in a 220 VAC line or
change the wiring on your 110 AC line. Can you measure the AC
voltage when you are key down?

: : KE6UKF

Helene,

Along with what Tom says, there's also this: You have to turn on the subaudio tone function as well. For example, I tried a couple of times, and never got anyone to call me back. Then a ham I knew asked about that function, I turned it on, he called the repeater to verify it, and it worked just great. The trick is, when you set the subaudio tone to whatever it is, when you have that freq in the display, do you also have the T-SQL showing in the display? If your freq is 146.840, for example, it would be right above that 1. To turn it on, press F and 1. If you check, T-SQL is right above the 1 on the DTMF keyboard. F is the top button on the side, of course. Just setting the subaudio won't do the trick, you still have to have the T-SQL showing so that you actually have it turned on to send the sub-audible tone you've set up. I stored mine in a memory so I don't have to fuss with it every time I want to use that particular repeater. That way I can leave it off for all the others and have it on automatically when I want to use the repeater that does require the sub-audible tone to activate.

Hope this helps get you going.

Bill B.
KC7JSD

P.S. if it helps, I missed that in the manual also. :-)

From: Bryan P King <kingbp@delphi.com>
Message-ID: <RW+cVgg.kingbp@delphi.com>
Source record: 216774

I am considering the Ameritron AL-811 linear amplifier for purchase and
am looking for any comments on the general performance of this or any other
Ameritron amplifiers.

The hf rig I have is a Ten-Tec Scout which has an output of 50w on SSB &
CW. The rig does not have any controls for driving an amplifier however
Ten-Tec did leave a connector inside the unit for switching an amp.

The specifications on the Ameritron AL-811 state that typical drive rated
outputu is 50 watts. Does this mean that my scout has sufficient output
to drive the amp?

Does anybody have any mods for the Ten-Tec to drive an amp?

73's

Thanks,

Bryan King - KA1FQT

>>with a Kenwood 520 as a second alternative.

>The Yaesu FT-101E, which I still use, also has sweep tubes. Maybe one of the
>early solid state rigs (Icom) would be a better choice.

All good advice. The Kenwood 520 is a great rig, but not solid state finals. The Kenwood 120 and 130 are pretty good for the money. The old Icom 701 is a good rig, and can be gotten pretty cheap when you find one. BUT, how about good old American built stuff? The Ten Tec rigs of the same era are all vastly superior CW rigs, and certainly equal or better for SSB. They are generally lighter, though larger, and easier to service, and Ten Tec still supports them (our Japanese manufacturers, notably Kenwood, does not go back very far....)
Look at the Ten Tec Triton IV, 540 (analog) and 544 (digital), the Argosy, and the older OMNI A, B or C. Very good radios. The Tritons regularly go for $300 and less, the Argosy for just over that, and the OMNI's can go $300 to $500 depending on filters and accessories.

Just my two cents!

REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.audio.tubes

Summary: Discussion of electronic audio circuits which use vacuum tubes
Proposed by: Reid Kneeland (reid@tti.com)

RATIONALE

Although the transistor and its relatives have largely replaced vacuum
tubes in modern electronic products, there remains a substantial set of
people who, for various reasons, prefer tube (or "valve") equipment,
and there remain many companies which produce such products. There are
also a great many "vintage" audio products of various types which often
need to be modified, repaired or restored. There are a number of
special issues associated with tube electronics that are not of concern
to most users of audio equipment, and there is currently no one place
for discussion of these topics on the Net.

Discussion of this topic is terribly scattered throughout the Net,
depending on the application, and is frequently of interest only to a
very small segment of a given group's readership. Sci.electronics is
populated mostly by professional EEs, very few of whom care much about
tubes and many of whom are often downright hostile to non-EEs posting
with tube-related questions. Rec.audio.tech covers too much territory,
and has of late fallen into flame wars - it also tends to ignore guitar
amplifiers, one of the largest market segments for tube equipment.
Rec.audio.high-end, rec.music.makers.guitar and rec.antiques.radio+phono
all include some discussion of the subject, but are also very specialized
in their applications.

CHARTER

Rec.audio.tubes is dedicated to the discussion of vacuum tube
audio equipment, including the following topics:

* hi-fi applications
* guitar (and other instrument) amplifiers
* radio circuits
* theory and design
* vintage and modern equipment
* repair/modification/restoration
* purchase recommendations.

Participants from all backgrounds are welcome.
```

DISCUSSION

Interested parties are encouraged to discuss this proposal:
PLEASE post your comments ONLY to NEWS.GROUPS.

This is *NOT* a Call For Votes (CFV)! The Call For Votes will be
posted approximately 21 to 30 days from now. An independent third
party will run the vote, and instructions will be supplied at that time.

This RFD has been posted to the following newsgroups:

news.announce.newgroups, news.groups, rec.audio.tech,
rec.music.makers.bass, rec.music.makers.guitar,
rec.antiques.radio+phono, rec.radio.amateur.equipment,
sci.electronics, alt.guitar.amps

and to The Bottom Line (bass players' mailing list)

Please forward this to anyone you think may be interested. Thank you.

I would think you need either CB radios or some type of commercial communications system. This is definitely a business type of communications and therefore not permitted on the amateur bands.

I, too, have the Ft2400, but disagree on the knob-type tuning problems;
nor have I experienced any of the other described problems. Mine's over
a year old.

Yes, it is a late model amp, and the main reason I bought it is for
the helical filter. The "bypass" occurs when you shut the power off -
i.e. there is no other cabling arrangement to make.

I am seriously considering getting into amateur radio and would like some comments on the FT-840.

It was proposed to me as a suitable replacement for my Shortwave Radio and the ideal step into the ham world if I so decide.

Any comments about the reciever section would be helpful as SWL is my primary interest at this time?

Any negative thoughts?

And other preferences in the same price range?

Lewis

4798. Yaesu FT11R Mods???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-07 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.15464.7583.0NFBA662@woodybbs.com>
Source record: 216707

Subject: Yaesu FT11R Mods???

>>I am wondering if anyone knows of available modifications for the
>>Yaesu FT11R. Any information would be appreciated.

This mod gives you extended transmission range on a Yeasu FT-11R.

I have knowlege that this mod works, but take no responsibility for any
damage it does to your radio, the legality of this mod, or any other
incurred damages.

After the mod a FT-11R will have:

Recieve: 110.000-135.995 (AM) 136.000-180.000 (FM)
Transmit: 136.000-180.000 (FM)
Empty Memories and a completely reset radio

First, Remove the antenna, battery pack, and pocket clip (if installed)
from the radio. Then remove the four black screws from the corners of
the main section of the radio, the two black screws from the bottom center
section of the main body, and the two silver screws from the bottom of the
keyboard section. Now carefully separate the back and front halves of the
radio, taking care not to put too much strain on the internal ribbon cable,
or loose the small metal strap holder or the battery release button.
Once you have opened the radio, carefully remove the metal plate covering
the back of the keyboard. Then remove the "AF" pcboard by first removing
the two copper screws in the middle of the board, then holding the bottom
of the pcboard and the mic/speaker jacks between your thumb and forefinger
and pulling straight up. This may take a little force, as you are
seperating two connectors. Once you have the "AF" board removed, set it and
the connector/keyboard backplane board aside. Now look at the lower left
corner of the controller board. You should see the 8 jumpers (they are very
small), set up like this:

Top of radio

L A o-o o o E I don't know how the jumpers relate to the
E B o-o o o F ones on the schematic, so the letters are just
F C o o o/o G for reference in this article
T D o-o o o H
"-" means a solder jumper, and "/" means resistor

These are the functions of the jumpers that I know of:
A- Turns your radio into the euro version (TX between 144.000-146.000)
B- ?
C- ?
D- This is the important one. Gives you extened TX range

E- Turns your radio into the 440Mhz version. Not Suggested!
F- ?
G- ?
H- Same as jumper "E"

The only jumper that this mod deals with is "D". It currently has a solder jumper across it. Remove the solder across the jumper with really small solder wick or a desoldering station, taking care not to touch any plastic with your soldering iron. Once this solder jumper is removed, you now have extened tx range. Now carefully replace the "AF" board first, and then the connector/keyboard backplane board. Take care to get the copper grounding connector on the side of the mic/speaker jacks well seated. Replace the two copper screws in the middle of the "AF" board, and the two silver screws on the bottom of the keyboard. Replace the battery eject button and strap holder, and then replace the back half of the radio. Replace a the screws, put the battery and antenna back on, and turn the radio on. You should see 144.000 on the screen. Turn the radio off and the hold the MHZ/\ and MHZ\/ buttons while turning the radio on. You now have the transmit range between 136.000-180.000.
As a suggestion, you can store completely different transmit and recieve frequencies in a memory (see manual), so if you store a service frequency in a memory, you can program a legal HAM frequency as the transmit freq. so you never accidently transmit on an illegal frequency.

Another neat feature that I have found on these radios is the "Clone" feature. You can transfer all memories from one FT-11R to another FT-11R. First, make a cable using two male stereo 1/8" connectors,
and connecting the top(gound) and middle conductors of the plugs straight through. Don't connect the tip conductors together though. Plug this cable into the earphone jacks of the two radios, and on each radio, hold down the "FM" button while turining it on. You should see every character flashing on the screen. Now, on the radio which you wish to recieve the memory contents from the other radio, press the MHZ\/ button. You should see "RX CLN" on the screen. Then on the radio which is to send it's memory contents, press the MHZ/\ button. "TX CLN" should appear on the screen for about 5 seconds, then it should return to the flashing screen state. The recieving radio should now be in normal operating mode. Turn both radios off, and remove the cable. That's it. This function overwrites all of the recieving radio's mem contents, and copies everything from memories to pager codes to the status of the light. WARNING: The instant that you hit the MHZ\/, your memories are GONE, even if the transfer is unsuccessful! Also, both radios must have the same jumper settings to successfully complete the cloning process.

>it.
I have owned an Alinco DJ560 and now own a Yaesu FT530. The Alinco
suffered from a very bad intermod problem and could not be used at large flea
markets with many hams transmitting on freq's near the one I was monitoring.
I sold it and bought the Ft530 which is constructed better and has no
intermod problems. I also like the speaker mic that the ft530 has which
includes a lcd that displays freq. The yaesu has a backlighted lcd on the main
unit as well as on the speaker mic. Three of my hams friends also bought the
ft530 and are very pleased with it. I have also heard that the dj580 will
overheat after 5 to 10 minutes of operation when running from 12v supplies.
When this happens the unit will get distorted audio and may shut down...this
does not happen on the ft530 which I run from 12v all the time in my shack.

The PRO-43 was a great scanner. It's been discontinued due to
the cell phone fiasco.

A good RS Model for rail fans is the PRO-62. Does not receive
military aircraft band but DOES have triple conversion like
the PRO-43. A recent review (by Bob Parnass, I think) stated
it has better intermod rejection in the railroad freqs than
the PRO-43.

>
>Can someone tell me the model number of the lithium battery in the 2400?
Also,
>any warnings in the owner's manual?
>
>advthanksance.

I'm assuming this is a Yaesu FT-2400H. If so, replacing the battery is straightforward: First, of course, turn radio off and disconnect the 12V supply. Then remove the two Allen screws on the ends (sides?) of the front panel and tilt the panel up and away from the rest of the radio. The battery is immediately visible, it is soldered on over one of the chips and covered by a round sticky label that I assume is there to prevent shorts. Part number is CR2076, with solder tabs. I think the owner's manual treated battery replacement as a task for the Authorized Service Center, but I don't have my manual handy either.

Note, however, that my 2400 has a good battery (the original one) and still a propensity to periodically forget everything. So replacing the battery may not help any. You may want to open your radio up and check the battery with a voltmeter before trying to obtain a new one. Normal voltage of these batteries is 3V.

I think it is a design flaw (along with the well-known skipping encoder problem.) Perhaps someone knows the cure for these. I think Yaesu had some mod to help the encoder one but I have not heard any details.

-Mike KD4QDM

4807. Icom IC-701 ALC/VOX Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-07 00:00:00 UTC
From: gregl@iglou.com
Message-ID: <D9s14s.JLK@iglou.com>
Source record: 216785

I bought a used Icom IC-701 about a month ago and it's been driving me nutes on SSB. The rig did not come with a microphone and I've been using it mostly on CW -- works like a charm on CW. I've been trying to get a microphone working with the IC-701 unsuccessfully (was using a gooseneck mic on the Realistic HTX-100). I then borrowed a friend's SM-2 microphone and it seems to work fairly well as far as audio is concerned. What's bothering me is that the ALC meter never moves on any band other than 40 meters. On 40 meters the ALC meter move only occassionally and then only for a very short burst. I am also unable to get VOX to work correctly. Every now and then VOX kicks in for a second, but for the most part it doesn't.

Anyone have any idea where the problem might be? As I said, the audio seems to be fine with the SM-2 electret microphone with preamplifier although none of my dynamic microphones seem to work right (the best I've gotten so far with a dynamic element is "Donald Duck" with either 1uF or 10uF capacitors in series).

Greg, I'm not familiar with the mic preamp in the Icom, but you might want to check the specified input impedance. My older Yaesu FT-101 feeds mic input directly to the gate of a FET and the owner's manual specifies 50K input.

If the problem doesn't appear to be a mismatch, then I suspect the AF circuit is in need of repair.

Bill Harwood (harwood@sirius.chinalake.navy.mil) wrote:
: Assume that the computer stuff is in metal cases and not plastic. If
: not get the computer stuff in metal cases first.

: Three things to try:

: 1. Make shure that you have a good RF ground (long ground rod and low
: inductance connection) for the radio gear. Now connrct the case(s) of
: the computer stuff to the RF ground with low impedance path. This
: should solve a lot of problems. Use of a ground strip arangement is
: recommended.

: 2. Make shure that all of the cableing to printers, monitors, TNC's
: disk drives ... is 100% shielded and have metal hoods. Most cheap
: cables with plastic hoods (formed hoods) are not shielded at all. TNC's
: are notorious for RF noise on the cable.

: 3. Try some snap on ferrite beads on the power cables, monitor
: connection cables, printer cables, RS-232 cables ...

You must also have all screws of the computer metal box on and screwed tightly,
RF can escape from screw holes !

If all that does not work, you can always make a grounded chicken wire
enclosure for your computer...

Radio Receivers for Sale
World Wide Receivers
#1 Global NR-82 F1 Description
With something for everyone. The digital frequency counter makes accurate tuning easy. Covers everything from Aeronautical and marine Beacons through AM Broadcast, the entire Short Wave band, and so on up through TV, FM Broadcast, Aircraft, Police, Ham, Marine VHF, to the UHF Public Service band. On Short Wave bands, a calibrator, BFO, Upper or Lower sideband switch,wide/narrow band width switch, RF gain allows you to turn off the dial light and digital display to conserve power when runningon batteries. truly a receiver that will offer a wide range of enjoyment for the whole family.
Cost New $500.00 Asking $275.00 Firm Radio is in very good working order and at this price to be sold as is first come basis. {db}

#2 DX-440 Realistic
Features
Wide tuning range, Fast response LCD display, Direct Access Keypad, Up to 9 Storable Frequencies, Multiple Power Source Operation, Supplemental Tuning controls, Dual Mode function Switch, Scanning Control, Full Range Tone controls, Stereo HeadPhones Jack, Plus loads of other features.
Cost New $300.00 asking $175.00 Firm Radio in very good working order and at this price to be sold as is first come basis. {db}

>Thanks for the info.

>73s, Steve WA6TAF

You can operate 2 meters all over Norway, there are several repeaters
in operation. xmit is always -600. Rx channels are 145.600 625 ...
775.

There are also some repeaters on 12.5 boundaries. All repeaters are
free and open to everyone and can be opened by the 1750 Hz tone. Some
repeaters alse opens by using DTMF try *8.

Obtaining a license is easy for US hams. Contact:

The digi-key filters do have a fair amount of insertion loss though.
I design and built a helical resonator from the instruction in the
ARRL handbook which has less than 0.1db of insertion loss (I actually
could have gotten better performance if I had designed for more
insertion loss) and can handle up to 15 watts meaning that I don't
have to switch it out on transmit. It a two section design with a
bandwidth of about 6 MHz. I use it mostly for T-Hunting these days.

4818. GPS Receivers

Message-ID: <3r7ae2$8v4@newshost.lanl.gov>
Source record: 216653

The tuning knob problem is well know and easily rectified.
The tuner is optical. The early models had no shaft seal they
got dirt in them and ceased to tune reliably. Yaesu replaced
my tuner no charge with no discussion of warranty. They apparently
discovered the problem in the units supplied to Nissan off road
racers and will fix yours if asked. The new tuner has a seal doesn't
feel as nice but works right. Other than that one of the best 2-meter
mobiles built. I had to sell mine when I ran out of space in my mini
truck and had to go to a FT-5200.

Hi Lewis,

I have recently qualified as a ham and am running a Yaesu FT 80 C. I hope the receiver specs i can supply will help. On CW, SSB & AM a double conversion circuit, clarifier range is 9.975 kHz. Sensitivity on SSB is 5 micoV and squelch sens. 2.0 micoV above 1.5 MHz. IF's are 47.055 & 8.215 MHz. Selectivity is 2.2/5 kHz - SSB, .5/1.8 kHz - CW. I have found great pleasure using the rig, although at this stage I only have an inverted V cut for one band.

hope this helps
Anton

4833. Re: PROM IN ICOM RP2210 REPEATER - HELP WANTED

In article <3r61o0$uha@news.ccit.arizona.edu>, cweddle@astro.as.arizona.edu (Chris Weddle) says:
>
>Hoping some body out there has figured out the finer points of the
>code in the 27C256 UV-EPROM in the Icom RP2210 220mhz repeater. Icom
>has been less than helpful. We've got the puppy ID'ing OK, but the
>repeater has some annoying operating habits.
> The ID interval uses the same software timer as the Time Out Timer.
> The ID speed and Time Out Timer intervals do not agree even closely
> to what Icom claims they should come out to for a given value.
Chris,

Did you ever stop and THINK That JUST Maybe that the information you received from Icom America was ALL THEY HAD ? Pretty bad to accuse them of being Less than Helpful. I would say if you received anything at all it surely was helpful, even if it was not exactly what you required. It seems as nobody believes anybody anymore as to just what kind of information is available.

The early repeaters did have the time out timer and CW ID timer as one timer, with no known way to seperate them. Open the pocket book a buy a newer controller if that one does not do what you require.

In the early 1980's the rules required to ID to be every 3 minutes, and the time out still is at 3 minutes. Icom uses a factory programmed eprom to set the ID speed. The factory identified one as 20 wpm, actually it is
30 WPM. Source code is the property of Icom, Inc in Japan, askinfg for the source is like asking Bill gates for the source code of Windows so you can compile your own, doubtful it will be let out in any direct form, however a enterprizing person could disassemble the code I suspose.

Gary

Ray,
I have been running a scout for a few months and have put many
hours on it. I work mobile CW, and some SSB. The radio is a
pleasure to use, has great audio, is very simple, and the rx is
very selective and sensitive. It does have a few shortcomings,, but
i stress that it doesn't kill the rig, it is the reality of compact, analog
radios!.

The fabled CW drift problem is real, and well documented. The on-air
reality is that the station on the other side will hear your tone
change a bit. It does not go scurrying across the band. The QSK
is smooth and the rx muting is "moderate". The Jones filter really works
but is not "stone-wall" sided. This is to be expected with a variable,
low(er) Q bandpass filter. The other downside of the Jones is that on narrow
widths it has .... does... exhibit attenuation within the passband. this
makes it hard to hear very weak ones through the filter. Honestly, when
i'm driving along looking for potential CW contacts, i want something
copyable.... not 339.

drop me some mail if you have any other questions.
brunelli_pc@delphi.com

P.S. I really like this rig!

The following was posted about 30 days ago, with no response received. So we are trying again. If you can help, please send Email to me at: bert.nagy@AtlantaGA.ATTGIS.com. I try to follow this group, but sometimes we do not get all the postings. If there is interest, I will advise you'all of the outcome: de N8GUU

RE: Kenwood TM621

I have a Kenwood TM621A dual band (144/220) VHF radio. I installed the CTCSS board to find out that it only works on the sub band. I called Kenwood technical support and they stated that, " That's just way it is".

I noticed that they have provided the ability to select which band has the CTCSS on their Model TM631A.

My question is:
Has anyone figured out a way to permit CTCSS to work on the main band of the TM621A?

Thanks in advance.

: Help. I need to replace the battery in my FT-2400, but I can't find my manual.
: I don't want to open it up until I have the new one handy (so I only have to
: reprogram the sucker once...).

I'm posting rather than e-mailing so that if I am wrong, we can both find out
before it's too late.

But, why not replace the lithium battery while the unit is on? For example,
on my HP100LX, to replace the backup battery, they recommend you plug in the
unit to the wall or turn it on so it is actively on the main batteries and
they are therefore maintaining the memory while the backup battery is removed
and replaced. Can't the same principle be used here? Just a thought on how
you _might_ be able to replace the lithium battery without having to
re-program the unit.

: Can someone tell me the model number of the lithium battery in the 2400? Also,
: any warnings in the owner's manual?

I've an FT-2500M. I can check in mine if you don't get any feedback on the
2400.

: - The world is divided into two groups of people: Those that own HP's
: and those that yell "HEY! Where's the equals sign?"

Amen! I'm one that yells "Hey, where's the Enter key???"

4847. Update -- PC-to-Yaesu HT Interface

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-08 00:00:00 UTC
From: "Michael J. Freeman" <afn10044@freenet.ufl.edu>
Message-ID: <Pine.A32.3.91.950608153448.56484A-100000@freenet2.freenet.ufl.edu>
Source record: 216731

On May 24th. I posted some information on the kit which allows you to program a Yaesu FT-11R, FT-41R or FT-51R from an IBM-compatible PC running Windows 3.1 or 3.11. This is the kit developed and sold by:

RT Systems
8207 Stephanie Drive
Huntsville, AL 35802

1-800-723-6922
1-205-882-9292

The following information is an update intended to answer many of the general questions that I received by e-mail and voice mail as a result of my original posting.

1. The updated version of the software included in the kit is now available. According to my contact at RT Systems:

a. Copies of this updated software should begin shipping to currently registered customers this week.

b. This updated software fixes *MOST*, but not all, problems which were discovered by users of the beta release of the kit.

2. The latest version of the software supports the FT-41R in native mode, without the necessity of first telling the program that the radio is an FT-11R.

3. Yaesu has decided to buy the rights to this kit from RT Systems and will be selling it worldwide as part ADMS-1. According to RT Systems, current customers can continue to receive support as before, without the necessity of using Yaesu as an intermediary.

4. Currently the software which is part of the programming kit is only available for the Windows 3.1 and 3.11 operating environments.

RT Systems is planning to write versions of the software later this summer which'll run under MS-DOS/PC-DOS without the necessity of running Windows.

5. RT Systems has a FAX machine located at 205-880-0332.

6. RT Systems has an Internet e-mail address of:

RTS@RO.COM

7. The programming cable which comes with the programming kit has a mini (1/8") stereo plug on one end and an RS-232C connector on the other end. Inside the RS-232C connector's shell are electronics specific to

the function of connecting to the Yaesu FT-11R, FT-41R and FT-51R HT's.

These electronics are *NOT* the same as those used by the kit
developed by Traveling Software which allows Casio Digital Diaries to be
programmed from a PC. Therefore, to use the Casio cable to connect your
PC to a Yaesu HT would seem to require rewiring the Casio cable to the
proper specs, which aren't currently documented by Yaesu.

There is also an 8 MHz trap in the SB10? and HW10? tranceivers that will cause a reduction of drive (and output) on 40 mtrs. It would be wise to check it. I don't have my manual handy or I would be more specific.

4852. Max. power on TS-820

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-08 00:00:00 UTC
From: tofull@ix.netcom.com
Message-ID: <3r5pr7$gdn@ixnews3.ix.netcom.com>
Source record: 216736

I am wondering what the maximum power output on a Kenwood TS-820 would be? The manual says under PLATE POWER INPUT that it has 200 watts PEP for SSB operation under the 120/220 VAC, 50/60Hz section and 120 watts PEP for SSB operation under the 13.8 V DC section...

How does the PLATE POWER INPUT correlate to the maximum power output for this particular rig? The age of the final tubes would be of some importance also...

Any explanation of how this is calculated would be of great help...

Thanks and 73's,

Unattended automatic forwarding of packet on HF was prohibited,
except for a STAY order for the purpose of experimenting, to
which a few persons were able to use. Now per PR Docket 94-59
which has just gone through, that type of packet will be
allowed once the FCC decides upon the subbands.
See QST August 1994, page 71 for more info.

4856. PROM IN ICOM RP2210 REPEATER - HELP WANTED

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-08 00:00:00 UTC
From: cweddle@astro.as.arizona.edu
Message-ID: <3r61o0$uha@news.ccit.arizona.edu>
Source record: 216740

Hoping some body out there has figured out the finer points of the
code in the 27C256 UV-EPROM in the Icom RP2210 220mhz repeater. Icom
has been less than helpful. We've got the puppy ID'ing OK, but the
repeater has some annoying operating habits.
The ID interval uses the same software timer as the Time Out Timer.
The ID speed and Time Out Timer intervals do not agree even closely
to what Icom claims they should come out to for a given value.

So what we're looking for is a copy of the source code. Or perhaps some one
out there has written their own operating software? We've talked with the
nice folks at Icom and they won't even discuss source code. What they said
should result in a 20wpm ID speed gave us 35wpm. After some fudging we got it
down to about 15wpm. CLOSE ENUF!? What they said should give a 3 TOT yielded
a 9min 45sec TOT!. Fudging has gotten us down to 7min 55sec TOT. And again,
this is also the ID Interval period as we can't seperate them in Icom's
software. Surely other folks have encountered these entertainments??

Any help appreciated - all help acknowledged.
Chris N7RME
cweddle@as.arizona.edu

PS: This repeater was purchased thru rec.radio.swap from some folks up in
Flint, Michigan. Got a good deal and the TX/RX are excellent performers.

Tom,
A pretty good figure for tube gear is power out = power in x 60%.
On the 6146b's this varies a little bit by frequency. On 10 meters about
50% to about 65-70% on 80 meters. This would be with "fresh" tubes.

>How does the PLATE POWER INPUT correlate to the maximum power output
>for this particular rig? The age of the final tubes would be of some
>importance also...

The best way to calculate the output is with a wattmeter and dummy
load. The efficiency of tube finals varies with circuit and tube
condition. In most cases, I find that a pair of 6146B's will be
almost 70 per cent efficient, so that 200 watts input will generally
give me about 140 watts output on a good day. You can expect
the range to be 60 to 70 per cent in most cases with the old Kenwood
rigs, in my experience (having had several of them, 520, 820, 530, 830).

With DC, the whole system is operating below optimum, and the input (and
resultant output) will go down, but it works fine. Consider that going
from 140 watts out down to 70 watts out will only reduce the signal by
3 db, which is very little under most conditions. Unnoticed by most
ops I have tried it on....no matter what they say! Don't fear lower
power - it is a way of life for some, hi hi.

>I need info on a Motorola C73CXB Repeater. How good is it? What is a
>retail price for a new one? What is a good price for a used One?

How good is it? If it's Motorola, it's good. They don't make anything but the best, at least in terms of quality and reliability. We can quibble on features, however. Also, Motorola stuff is not cheap.

The machine you described is an MSF-5000 VHF high-band repeater, 100-110 watts, 120VAC power supply. It also has digital capability. A very good machine. My company has a number of UHF MSF-5000s throughout the country and we have been very pleased with them, despite heavy, constant use.

I understand that they are no longer made, so the only market will be used. When they were being made, new prices for a well-equipped machine was about $12,000; fairly typical for its intended use. But, that may make even a used one out of reach for the amateur market.

If you know of one that is in good shape and at a price you can afford, jump on it.

Thanks for the reply.

Do you know anything about computer software that might be availible for
the 840? Especially for a Mac.

Fathers Day is close and I usually get to pick my own gift. It may be a
bit more expensive this year than usual. ;-)

Lewis

> than a TS-830S or a FT-902DM.

If you can spend $600 and above, I agree. Decent advice for that class.
However, in my humble opinion, the OMNI-D series C can hold its own with
either transceiver, has full break in CW, and is solid state (no tune up).

> You should get a tx/rx wich has all HF amateur Bands (classic and
> WARC) so that you can clearly see the difference between a low
> band like 80m and a near VHF band like 10m.

Correct. You might quickly miss the WARC bands if you did not have them.
The Ten Tec OMNI-D series C mentioned above is the one with WARC built into
it. The series B was easy to upgrade.

> Do not go for a single VFO Trans. otherwise you will risk yourself
> of missing a lot of good DX and don't forget that split operation

Yeah, split can be needed if you DX. Remember (am I sounding like an
ad here?) the Ten Tec OMNI has an external VFO that allows "dual receive"
which neither of those mentioned above do, and, indeed, the new $4k
Yaesu 1000D uses a second receiver to achieve...overkill unless you
want a second receiver in the same box.

> Finally if you'r not much of an electronics expert, try to buy
> a make where you can find assistance near.

Very very good advice. From Portugal? Thanks for jumping in OM! Might
see you out there on 20 some day. (with my Ten Tec OMNI, hi hi)

4866. FT757 AM filter mod needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-09 00:00:00 UTC
From: atla0001@gold.tc.umn.edu
Message-ID: <3rb5qe$asp@gold.tc.umn.edu>
Source record: 216600

I am in need of the modification information for a wide/narrow AM filter mod for the Yaesu FT757GX.

The mod consists of the installation of a DPDT switch and clipping a diode. I need the mod to repair a radio that was modified. I am looking for ASCII diagrams and/or descriptions of specific components to connect to (ie D1, D2, Q1, Q2...).

Please Email me info......or even where to try looking for mods via FTP (no luck at oak.oakland.edu).

Thank you.

ge> Thanks! E-mail to geoffs@onr.com

Goeff:

I'm surprised to hear that your Bencher is unsatisfactory. My 12-year old BY-1 paddle (black base) is still going strong. This is in spite of the fact that during the Summer of 1984, while I was operating portable out of a German Air Force base, I dropped the thing, works-side-down, on a concrete hangar floor! One of my German friends immediately recovered it, got out his tool box, and in about a half-hour, got it straightened out and back in perfect alignment! I gave him a pack of American cigarettes for his efforts! The Bencher has been perfect ever since; it's even outlived the MFJ Pacesetter electronic keyer that came with it. The only thing more reliable is my WWII-vintage Lionel J-38 straight key!

SE>I'm considering the purchase of a 2m amp for my car.

SE>I'm looking at RF Concepts, RS, among others.

SE>What are comments on the RS amp? Anyone use it?

SE>I'd like to hear any horror/success stories.

SE>Some specs are .5 - 5 watts in, 30 watts out.

SE>Thanks.

I use the RS amp with an HTX-202 in the car...only problem I have is
downtown (a bit of intermod). I would suspect that an HT with a
looser front end would be more prone to intermod with this amp.
Otherwise, no complaints!

4871. FT990

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-09 00:00:00 UTC
From: pwang@tornado.seas.ucla.edu
Message-ID: <D9vt4E.AD1@seas.ucla.edu>
Source record: 216656

I have a FT990 with built-in antenna tuner. Testing it with a Yaesu dummy load/wattmeter, the wattmeter reads approx. 100 watts CW on all bands without the tuner in line. But with the tuner in line, it reads only 85 watts on all bands. The SWR is 1:1 in all cases. It seems that 15 watt loss in the tuner is very high. Is this normal? The rig is almost new. Any comments will be appreciated.

4872. This Newsgroup's Charter (long)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-09 00:00:00 UTC
From: bob@mtdcr.mt.att.com
Message-ID: <D9vxI4.7I0@nntpa.cb.att.com>
Source record: 216657

I know this article doesn't exactly fit this newsgroup's charter,
but I believe it belongs here, as it is pretinent to this newsgroup.

It seems like, a couple of months ago, a thread was started on
rec.radio.amateur.equipment about how lots of people were posting
"for sale" messages to this newsgroup by mistake. I exchanged
e-mail with the original poster (whose name I've forgotten -- sorry),
where I said the problem didn't seem that bad. I apologize. You
were right, I was wrong. Today, a solid 20% of the messages in this
group were FS/WTB messages. This is getting out of hand.

I know the Guide to the Personal Radio Newsgroups is posted on the
15th of each month. Jay does an excellent job with it. Are people
even bothering to read it? Here's what it says:

The swap group is rec.radio.swap. This recognizes a fact that became
evident shortly after the original group was formed: Hams don't just swap ham
radio gear, and other folks besides hams swap ham equipment. If you have radio
equipment, or test gear, or computer stuff that hams would be interested in,
here's the place. Equipment wanted postings belong here too. Discussions about
the equipment generally don't; if you wish to discuss a particular posting
with the buyer, email is a much better way to do it, and the other groups,
especially .equipment and .homebrew, are the place for public discussions.
There is now a regular posting with information on how to go about buying and
selling items in rec.radio.swap; please refer to it before you post there.
To answer a frequently asked question: No, there is no mailing list that
goes along with this group. If you can't read Usenet news directly, you're
out of luck.

...

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are
for more specialized areas of ham radio: discussions about antennas,
commercially-made equipment, homebrewing, and amateur radio space operations.
The .equipment group is not the place for buying or selling equipment; that's
what rec.radio.swap is for. Similarly, the .space group is specifically about
amateur radio in space, such as the OSCAR program and SAREX, the Shuttle
Amateur Radio EXperiment; other groups cover other aspects of satellites and
space. Homebrewing isn't about making your own alcoholic beverages at home
(that's rec.crafts.brewing), but rather construction of radio and electronic
equipment by the amateur experimenter.

...

What's the chance we can get this newsgroup back to its charter? It's
starting to become as bad as alt.sources! 8^{)

>If the problem doesn't appear to be a mismatch, then I suspect the AF
>circuit is in need of repair.

The microphone input impedence of the Icom IC-701 is 500 ohms nominal so the 400 to 600 ohm dynamic microphones I'm using shouldn't be a problem. This particular microphone (a pencil style dynamic on a gooseneck stand similar to Heil) I used on the Realistic HTX-100 for a long time and it worked great so I know the microphone is fine. The SM-2 microphone (electret condenser microphone with a preamplifier) seems to work well on the Icom IC-701.

I guess what I need to do is find and fix the problems with the ALC circuit first then check the microphone audio circuits.

I have owned two Alinco DJ580's and have enjoyed them. Never had any
of those problems that you mentioned. I have used them at hamfest's
with no problems. Only intermod problem I have had was when I was

using it at a radio site, with numerous transmitters going. I own a Kenwood TH78A now also and it suffers far worse than the Alinco on intermod. Also lets face it the Alinco has a FAR better sounding audio than most of the mini handhelds! Yes it does get warm when used for long sessions, but so does any mini handheld.

I cannot comment on your FT-530 as I have never operated one. But Yaesu does put out good products.

>Icom America was ALL THEY HAD ? Pretty bad to accuse them of being Less than
>Helpful.

I did think of that. I did ask that direct question. Was told it was around but would not be provided. Also, after much questioning and discussion it turned out that only 1/3 of the information set aside as available for public release was being provided. After receiving the missing stuff, it turned out to be filled with errors. CAN YOU SAY FRUSTRATED!?

>I would say if you received anything at all it surely was helpful, even if it
>was not
>exactly what you required. It seems as nobody believes anybody anymore as to
>just what
>kind of information is available.

Of course I believed the person who told me I couldn't have what I was being told existed. And yes, I certainly appreciated being told that all the info I asked for was being sent to me. But when I got it, it was wrong. And questions I was told would be answered weren't even mentioned.

>The early repeaters did have the time out timer and CW ID timer as one timer,
>with no
>known way to seperate them. Open the pocket book a buy a newer controller if
>that one
>does not do what you require.

I have personally spent some $7000 on Icom products in the past 6 years. The group I belong to has about 80 amateurs - at least 90% use Icom products. I'd say the "pocket book" has been quite active in Icom's favor. Over the past 12 years in the volunteer EMS work I do, I've spent in excess of $25000.

>In the early 1980's the rules required to ID to be every 3 minutes, and the
>time out
>still is at 3 minutes. Icom uses a factory programmed eprom to set the ID
>speed.

The repeater is of quite recent manufacture.

>The factory identified one as 20 wpm, actually it is
>30 WPM.

It would have been nice to have been told that by Icom when I asked the question, rather than being told I'd programmed the thing wrong and hadn't followed their instructions.

>Source code is the property of Icom, Inc in Japan, askinfg for the
>source is
>like asking Bill gates for the source code of Windows so you can compile your
>own,
>doubtful it will be let out in any direct form, however a enterprizing person
>could
>disassemble the code I suspose.

Comparing the contents of a 32K by 8 chip which no one cares to use to the source code for Windows!? WOW! When buying both less and more expensive instrumentation in the industry I work in, it's common to receive source code to aid in developing new applications. The point being that the hardware is the most valuable component, and improving the software simply adds to the hardware's value. When building computer-based data acquisition systems, I would always share my software with the vendor. They seemed to appreciate that.

>Gary
>
>>
>>Any help appreciated - all help acknowledged.
>>Chris N7RME
>>cweddle@as.arizona.edu
>>
>>PS: This repeater was purchased thru rec.radio.swap from some folks up in
>> Flint, Michigan. Got a good deal and the TX/RX are excellent performers.

Finally, I do happen to be a big fan of Icom products. I'm often not impressed with service, but the toys are just dandy. An effort is under way to develop better software and hopefully save a lot of money. I do not want anybody to offer me source code which has been unlawfully obtained. But if someone has already solved this problem by writing a new package all their own, I'd sure appreciate some time-saving assistance. These days, time is in as short a supply as money.

Chris

4878. HELP! Yaesu 2500m Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-09 00:00:00 UTC
From: ddervin@infinet.com
Message-ID: <3r8u0b$26b@horus.infinet.com>
Source record: 216663

Hey folks-

I can't find any mods for my 2500m. Can anyone help,
or point me to a www or ftp server that they KNOW
has one?

Thanks-
73

ddervin@infinet.com

4879. Icom 3900 Manual

4881. How can I contact Doug Hall Electronics?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-09 00:00:00 UTC
From: negaard@draagen.graceland.edu
Message-ID: <NEGAARD.95Jun9083242@draagen.graceland.edu>
Source record: 216666

Our local club, the Lamoni Amateur Radio Association, is interested in adding remote-base operation to its repeater. Club president Bob Farnham (farnham@graceland.edu) contacted ACC (manufacturers of the repeater controller in use here), and received a reply stating "you can use certain Kenwood mobile radios with Doug Hall Electronics RBI-1 interface." Bob hasn't had any luck finding Doug Hall Electronics, so he asked me to query the expertise of the net for assistance.

If anyone can point us in the right direction, I would be most appreciative. If there are other solutions possible (the controller is an Advanced Computer Controls RC-96), I expect we'd be interested in hearing about those, as well.

>Any negative thoughts?

Lewis,
I have used the 840 a few times and the RX is superb. My dad has been
using his 840 for almost a year and i have used it for SSB, CW, and
SWL. The rx has great audio, nice and selective, but may be a bit
tight for hi-fi broadcast audio. It runs for as little as $799 new
Okla. Comm. Ctr. for one source, and is compact enough for mobile ops.

Hi There

Can someone please help me find some information on a device
called an RRI (Remote Receiver Interface)...

This device enables a modem that is receiving serial data to
auto-answer incoming calls by "blocking" the data until a
connection is made. The unit retail for about $100.

I would like to purchase one of these devices and would appreciate
any information on companies that sell them or brand name manufactures
so far I have had no clues.

regards

Alexa Wing

Greg, unless a person advertises that he is using an amateur radio on non-amateur frequencies, chances are very good that nobody will say anything!

I know of numerous 2-way shops that buy amateur products for their versility. There isn't any manufacturer building dual-band products for the commercial frequencies except for Yausu. (At last check anyway). Try to get a dual band Motorola radio! It doesn't exist.

Face it, the amateur manufacturers have produced radios such as these to tap into the "hidden market".

Excuse while I put on my flame-proof
suit.....

: >The Yaesu FT-101E, which I still use, also has sweep tubes. Maybe one of the
: >early solid state rigs (Icom) would be a better choice.

: All good advice. The Kenwood 520 is a great rig, but not solid state
: finals. The Kenwood 120 and 130 are pretty good for the money. The
: old Icom 701 is a good rig, and can be gotten pretty cheap when you
: find one. BUT, how about good old American built stuff? The Ten
: Tec rigs of the same era are all vastly superior CW rigs, and certainly
: equal or better for SSB. They are generally lighter, though larger,
: and easier to service, and Ten Tec still supports them (our Japanese
: manufacturers, notably Kenwood, does not go back very far....)
: Look at the Ten Tec Triton IV, 540 (analog) and 544 (digital), the
: Argosy, and the older OMNI A, B or C. Very good radios. The Tritons
: regularly go for $300 and less, the Argosy for just over that, and the
: OMNI's can go $300 to $500 depending on filters and accessories.

: Just my two cents!

: Clark
: WA3JPG

I think that you should first think about what are the basic
needs of an HF operator and then find an HF rig that satisfies
the maximum.
Personaly I do not advise anyone to get an very old transceiver.
Even if it uses tubes in the final stage it shouldn't be less
than a TS-830S or a FT-902DM.
You should get a tx/rx wich has all HF amateur Bands (classic and
WARC) so that you can clearly see the difference between a low
band like 80m and a near VHF band like 10m.
Also know how propagation changes in each band.
Do not go for a single VFO Trans. otherwise you will risk yourself
of missing a lot of good DX and don't forget that split operation
is vital for communications between the US and the rest of the
world (a major part at least) on the 40m band.
A digital frequency display is also much more precise and confor-
table to read.
Finally if you'r not much of an electronics expert, try to buy
a make where you can find assistance near.
I can remember much more now, anyway I think this will help you.

: 73,
: Ray KE6TYH

I've seen one once, and it is surelly beautifull.
Nevertheless I think it is more like a 2nd Transceiver,
used for Field days, etc...
Also the band-switch (changing cartriges) is not very
pleasant.

I do not doubt about the quality of its constrution, but...
... it still looks like a portable HF.

>-Mike KD4QDM

I have to say, Kenwood has allways had a very ergonomic design, with the best menuing features on their latest dualband TH79A.

Generally, Icom has the nicest quality sounding radio, but lacks many of the accessories. Accessory addition can raise the radio cost to as much as 30% more than the competition.

Kenwood produces what I consider to be second best in audio quality and sensitivity to Icom, but they generally include most of the required accessories that Icom left out. This is done at a price like that of many of the other company units.

Yaesu had, for many years produced equipment which had many problems with design and quality control. Now Yaesu has move back with the best, but I

still don't trust them.

Standard and Alinco and the rest, in my opinion are clones, like clone computers. If you want the best equipment, which is most widely used and serviced, I don't vote for these.

For the money and servicability, I vote many times over for Kenwood equipment.

Good Luck - WD9AIS / John

Don't bother with the Ramsey kits. They are junk!!! Many of my friends have repeatedly said don't build the Ramsey radio kits or amp kits.

Look to getting an old ht. You can usually find an old synthised Tempo in the $80-$125 range. This should do, along with a video Camcorder battery. You can get a battery clip through "The Battery Works of Barrington", in Barrington, Illinois (708 area code).

With the ht, box, battery, clip and ID'er you should get by for less than $250 total. If you solder to the battery, have the ID'er and box, you can do the remaining for $80-$125.

>Thanks, Michael Raider, KO6BC

I think you'd be better leaving the pipe connected to the house ground. In fact you probably should Connect the circuit breaker box (green ground) to the same pipe.

If the pipe becomes discontinuous, (ie. inserting the pvc), you have a floating ground, connected intermittantly by water to earth ground. Should the potential for the water pipe to increase, you could damage your equipment, should you have a lightning storm.

>terry@sdsc.edu (alternate address; I live in Tucson)

Get a battery/ac operated AM-FM radio. On the AM band, on batteries, move the radio around the computer equipment. If there is noise related to the computer equipment, your noise is airborn. If there is no noise, connect the radio to the AC line. If the noise becomes present while the radio is on AC, you need better line filtering. If there is still no noise present on the AM radio, you may need special notch filters on the harmonics your problem is present.

Perhaps try also, sheilding some of the leads around the computer equipment. Exiperiment with aluminum foil.

Note the callsign of one of the stations you hear. When their conversation is over, call them by transmitting their callsign, followed by your callsign:

"W1ABC from W2XYZ"

> I bark out my call signal...

It's not necessary to yell, or even to raise your voice; this does nothing to enhance your signal on FM. Just speak into the mic in a normal conversational tone.

They should reply. You might check your offsets; it can be trickey -- some use positive offsets (+600 KHz) and some negative (- 600 KHz). When the repeater is not in use, click the push-to-talk button for half a second, then release. You should hear the repeater come up, and probably transmit a beep. This is called "ker-chunking" the repeater, and is generally not a good idea, but in your case doing it once or twice to make sure you've got the frequency and offset set correctly is probably ok. If you can't get the repeater to respond, try to find a local ham with a bit more experience to give you a hand. As a last resort, you could try taking your rig back to the store where you got it to see if they can helo you set it. Best of luck.

Like my Icom. Like my Kenmore...er...wood too.

This is really a "ford man/chevy man" type problem. No one to my knowlege has done a survey on reliability. Some makes have a reputation for being more reliable than others, but this is probably due more to the whims of gossip than to any hard data.

Magazine tests have shown that radios usually meet or exceed their published specifications. I don't recall seeing any rigs that did not from the major manufacturers.

Audio quality for transmit or receive is really a very subjective thing to judge. The best way to decide is to listen for yourself!

Not very helpful, am I?

I will say that Yaesu's manuals are much better than Icom's or Kenwood's, but that has little to do with the actual performance of the radio.

I do tech writing so I'm sensitive to things like that :-)

Hi all,

I've been looking for a manual or schematic for a Motorola MAXAR, model D34TRA6000AK. This is a 450 MHz dash mount radio. It's a MAXAR, not a MAXAR-80, by the way.

I desperately need a schematic to convert it to 9600 bps packet. I'm willing to pay for a manual or even just a photocopy of the schematic. I could use a copy of the board layout as well, but could survive with the schematic alone.

Motorola Parts Dept is sold out and won't supply me with one.

PLEASE PLEASE HELP ME FIND A SCHEMATIC!!!

73,

Jeremy WA7YGB

I'd say the plate power supply filter capacitors are tired. You can replace them with modern Panasonics or equivalent, of the same capacitance or higher.

There is only 1 mod for the 2500, regarding opening the tx to 140-174 Mhz. It involves taking off the top of the radio and cutting the short, very thin green wire atop the board near the low and mid power pots. There is no extended rx mod, so we're stuck with the stock 140-174 rx. Be careful with the little plastic plug when reinstalling the top cover. Follow the manual exactly when replacing the cover. I believe there is also a packet mod, as explained in the manual, but I haven't done that one. 73/Terry VE4UC

Well, I have had a FT2400 for 3 years now....
I have the exact same problem with the tuning -
(probably a loose part common on well used rigs)
The front end is tight, and the signal quality
has been described as excellent. No other problems.
I have used this rig on field days, for packet,
DX (meteor scatter, tropo, sporatic-e),
mobile and in the house.

My thoughts on this....

The law is the bottom line (there are always good reasons for them)

But here's on example:

We use business band radios in the shop (460 and 480mhz)
and I own a dual band Kenwood th-78a with mods.
I could transmit within transmit power and specs (spurious output) and
deviation, but it is not 'type accepted' - I'm not doing anything that
disturbs anyone, and a fcc monitoring station couldn't tell,
only if they actually looked at what radio I was using.
I just doesn't make sense to carry 2 radios around with me,
When I can just use my one HT, and have amateur and WX RX, too!

Not Fair. But the law keeps people from trashing the airwaves.

I saw your inquiry re: GPS units. I recently purchased a Garmin GPS 45 and like it very much, except for one thing. Battery life. Garmin claims 10 hours on 4 (AA) batteries in Normal mode, and up to 20 hours in Battery/Save mode. I have experienced about 5 hours/Normal, 8-10 hours/Save mode. Outside of that, it is GREAT! Excellent display, "user friendly", 250 waypoints, one-hand operation, etc. I would recommend the GPS 45 over the GPS 40 because of the external antenna and 7-40vdc input. But it depends upon your application(s) for it. If hiking, you may find the GPS 40 meets your needs.

>>: I'm hoping to put a Motorola handheld mike onto my Alinco 580T.
>>: Has anyone tried transplanting one of these onto an HT?

>>Yep, to a Yaesu FT 530.

I put a Motorola mike on a FT-530 also. I just took a Radio Shack mike cord and connector and replaced the cord on the Motorola mike. On mine I had to rewire the PTT and mike lines inside the microphone. It involved a little cutting of traces and adding and removing some components but it now works great. If you look at the back of the package that a Radio Shack mike comes in, it will tell you how the wiring needs to be in order for it to key the radio. My Motorola had a little circuit board in it for the PTT and mike so it was not very hard. Email me and I will send you a longer description of what to do.

Source record: 216613

I recently bought an FT-2200 for mobile. The rig is fine, but it is the European version, with quite a lot of functionality locked out.

I have taken it apart far enough to find the cut/solder links behind the front panel which must enable and disable the various features. However, there are 12 of them, and they are very fine - I suspect they wouldn't survive very many connect/disconnect cycles with my heavy-handed soldering - which discourages me from starting to experiment with them from scratch.

So does anyone have any info on the functionality enabled/disabled by the various links? Alternatively, perhaps amateurs with different models would like to note the settings so I could attempt some correlation?

Please e-mail me with any info, and I will collate whatever I get and post a summary to the group.

Hope the following is what you require.

1. No connection
2. 13.8 v DC in conjunction with the power switch operation
3. connected to push-to-talk. T/R change over switch. When grounded
the set operates in the transmit mode.
4. Output from the receiver detector stage. Fixed output regardless of
AF output or gain.
5. Output from transmitter Mic amp stage (input for MIC gain control
stage.
6. 8vt DC availaable when transmitting. (relay cannot be directly
actuated. Max 5ma)
7. input for external ALC voltage.
8. Ground.
9. Input for RTTY keying. (Mark: High level, SPACE: Low level)
10. Input for TRVA transverter control signal.
11. Input for TRVB transverter control signal.
12. Output reference voltage for band switching.
13. INPUT/OUTPUT for external band switching.
14. Input for TUNE mode. When +9vt is applied, the set operates in the
CW transmit mode.
15. Input for external noise blanker control.
16. Input for external control (DBC signal)
17. NC
18. Input for external control (RC signal)
19. Output for external control (DV Signal.)
20. Input for external control (RT signal)
21. Input/output for external control (DB1)
22. Input/output for external control (DB2)
23. Input/output for external control (DB4)
24. Input/output for external control (DB8)

I Have never used this socket and would like to know how you get on with
your project.

>Face it, the amateur manufacturers have produced radios such as these
>to tap into the "hidden market".

Manufacturers produce radio that can be modified because it means they can reduce the different kinds of things they need to purchase, make, and stock, creating a great savings in the manufacture and a corresponding great increase in profits. That's the only reason. They don't give a rat's ass about ham radio operators, listening in to cell phones, or anything else.

Now, to answer the question, I use my TH-78a (modified) when I'm on duty during a search and rescue operation instead of the for-SAR ICOM "bricks" the Sheriff's Dept. owns. Why? Because (1) batteries last longer, (2) better tx/rx, (3) I can monitor multiple freqs - talking a helicopter in on one while hearing how my teammate is faring on another, etc.

After I published my TH-78a mod faq (avail on my web site) I was called by the Emergency Services Dept of a Southern Calif town who'd heard about it, purchased and modified a bunch of them, and used in them in the last really big earthquake.

I never tx out-of-band when not on an operation.

I've had one for a year now. As posted earlier, the receiver is great!
I'm very happy with the rig. I would recommend it. If you want to
replace your SW radio, you may want to pick up the YF-112A 6-kHz
Filter for improved AM reception.

Maybe so. Does that mean it's right? I could run 3000+ watts on HF, and unless I said something, chances are very good that nobody will say anything...

>I know of numerous 2-way shops that buy amateur products for their
>versility. There isn't any manufacturer building dual-band products
>for the commercial frequencies except for Yausu. (At last check
>anyway). Try to get a dual band Motorola radio! It doesn't exist.

If these shops are indeed doing this, they risk their licenses, as well as civil and possible criminal sanctions.

>Face it, the amateur manufacturers have produced radios such as these
>to tap into the "hidden market".

Take a look around the rec.radio.amateur.equipment newsgroup. I'd bet you that fully 10% of the discussion about modern VHF/UHF amateur equi[ment centers around intermod problems, transmitter difficulties, etc. You don't see the same problems with most commercial gear, because it is built to a higher standard.

>
> This could be the result of something as simple as a leaky or
> dried-out coupling cap in the first or second stage of amplification.
> During your QSO's, what do folks say about the audio quality?
> Anything unusual?

The leaky capacitor is a definite possibility. The reports I've
gotten with my dynamic microphones have been rotten. I was
experimenting with capacitor values to put inline with the microphone
to knock out the 8 volts on the Mic pin. With .01 and .1 I got no
audio at all. I can't remember what I got with 1 uF, but it didn't
work right either. With 10 uF I got, "You sound like Donald Duck."

Oh, I remember. With the 1 uF capacitor I was getting bad audio (no
real description there) but was told the audio faded with long
transmissions.

The Icom IC-701 HF rig (and its twin IC-211 VHF all-mode rig)
originally come with an SM-2 electret condenser microphone with a
hefty preamplifier. I have a friend with an IC-211 so I borrowed his
SM-2 microphone and was told I sound great but at one point I was
told my audio faded out. That must have been a fluke because on
several transmissions on 10 meters that night with the locals, it was
great on all transmissions but one.

Now whether my audio was my usual "VHF self" is another matter. From
what I understand, I was perfectly copyable and sounded great.
Whether or not it was perfect audio I do not know.

4942. Kenwood TM-241 Mic.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-10 00:00:00 UTC
From: mallorys@nbnet.nb.ca
Message-ID: <950610220309.E7E916@news.nbnet.nb.ca>
Source record: 216631

Hello and thanks for reading this posting. I own a Kenwood TM-241 2M Tranceiver with the DTMF mic. When I use the DTMF pad on the mic the radio will transmit for about two seconds after the last button is pushed on the DTMF pad. Normally this is not a problem, except when you are trying to up link a repeater or use the phone patch is when it becomes most annoying.

What I would like to know is this. Is there a mod that I can do to either the radio or the mic. that will DISABLE this feature? Please post the information so that others would benifit. Also if you would be so kind as to e-mail me with the info as well, I would really appreciate it.

: a bunch of those 150Mhz bus-band hand-helds for $89, and a 440 Mhz Ham HT
: for $149.00. Is that a good deal?

If the 440 HT is the HTX-404, that is a pretty good deal. I bought a new
404 last month when they were on sale for $229.95, which was $70.00 off
the regular price.

BTW, to correct my previous post: The $189.95 price for the HTX-202 when on
sale was also $70.00 off the regular price of $259.95, not $229.95, which
was the sale price for the HTX-404.

When you consider the price of a similar Icom HT, $149.00 is quite good. I
figured that even at ~ $200, if these HTs hold up for a couple of years,
It was well worth the price. For that reason, I also passed on the extended
warranty.

4951. C568A Impressions... Revised

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-11 00:00:00 UTC
From: scam@siu.edu
Message-ID: <v01520d02ac00eac543a9@[131.230.253.12]>
Source record: 216557

This is a revised version of my earlier post, updated to include information regarding out of band transmit performance and a correction concerning the number of DTMF memories.

Note: The opinions expressed here are my own,
not of Stanard Amateur Radio Products, Inc. or
Marantz Japan, Inc.

The Standard C568A is the newest of the company's dual band HT series. The unit is a compact (measuring 134.5H x 47W x 34Dmm), high performance dual band HT capable of full operation on the 2m and 70cm amateur bands with a 1.2ghz suband. Dual in-band receive/transmit (VxV, UxU, VxU and UxV, Vx1.2, Ux1.2) is possible on 2m and 70cm, with the left side being the VHF main band and the right side being the UHF main band, with main band performance in the sub-band. 1.2 gigahertz operation is restricted to the right side. Output power is 2.6 watts (H), 2.5 watts (M), 350mW (L), 35mW (EL) on 2m and 440mhz at 7.2 volt with approx. 35mW out on 1.2ghz. The transmitter will produce 5 watts output at 12V DC in, via either the optional CNB172 battery or 12V input at the DC in terminal. No adapter is required for 12V operation.
The C568A receives from 110-199mhz, 310-399mhz, 400-499mhz, 800-975mhz (cell blocked), and 1.2-1.3ghz out of the box, no modification needed. Unmodified, the C568A transmits from 144-147.995 mhz on VHF, 438-449.995 mhz on UHF and from 1240-1299.990 mhz on 23cm. With the wide band transmit modification performed, it will transmit from approximately 120-190 mhz on VHF, 400-482 mhz on UHF and from 1200-1299.990 on 23cm. Transmitter output is resonably good across these ranges, as is receiver sensitivity, but the is a fairly significant dropoff in both TX output and RX sensitivity near the edges. Output was measured at more than 1 watt from 128-170 mhz on VHF and from 415-475 mhz on UHF. 23cm output was not measured. I've yet to measure RX sensitivity, due to the lack of a service monitor, but comparative test with Icom commercial HTs were favorable up to 175 mhz and 475 mhz. Sensitivity in the AM aircraft band and 300 mhz band wasn't measured, but aircraft band sensitivity seemed acceptable.
A combination of ceramic and bandpass filtering is used to provide for wide-band receive and decent intermod rejection. While the intermod rejection isn't as good as a Motorola Saber, with 9 high/low pass and 5 bandpass filters, it's MUCH better than anything Icom, Yaesu, Kenwood or Alinco currently offer. Multiple vcos for each band provide wide RX coverage, while insuring good sensitivity during sub-band operation. Sensitivity is rated at better than .16uV for 12dB SINAD, VHF/UHF amateur main band, and less than .18uV UHF amateur suband. (440 operation on the VHF side.) 1.2 ghz sensitivity is rated at less than .28uV for 12dB SINAD.
The C568A comes with the CMU160 memory unit installed, which provides for 40 memory channels, 20 per side, but any VHF/UHF combination

of memories can be stored, because sub-band (UHF/VHF) operation is possible on either the left or right side. There are sperate CALL channels for each band. All memories are capable of storing odd offsets, as well as CTCSS tone, DTMF squelch and paging codes and CTCSS squelch status. The are ten 15 digit DTMF memories for storing phone numbers or repeater control codes. (The QST ad states that there are 4 DTMF memories, but there are actually 10.) The optional CMU161 offers 200 channel operation. Memory scan is very speedy, but the number of channels per second is difficult to determine. It's not listed in the manual, but my best estimate is over 20 channels/second. During battery save operating scan speed slows depending on the save duration.
Current drain is listed as follows:

Transmit:
13.8V: 5 watts: 1.1A VHF
1.3A UHF
2.5 watts: 850mA VHF
950mA UHF
7.2V: 2.6 watts: 880mA VHF
980mA UHF
2.5 watts: 850mA VHF
950mA UHF
350mW: 480mA VHF/UHF
50mW: 100mA VHF/UHF
35mW: 120mA 1.2ghz

Receive:
Sqelched, dual band: 68mA
Suelched, mono band: 37mA VHF
48mA UHF
52mA 1.2ghz
Battery Save, dual band: 28mA
Battery save, mono band: 17mA VHF
18mA UHF
20mA 1.2ghz

Note that these are nominal specifications, NOT best case scenario figures. The actual current drain is often significantly LOWER than these numbers. This is why Standards get the better battery life.
The C568A is constructed of cycalac (what Motorola GPs are made of, although not nearly as much of it, the walls are thinner.) and aluminum alloy. The alloy back doubles as a heat sink, of course, for high power operation and to dissipate heat generated by the voltage regulator during 13.8V operation. It's very solidly built and feels rugged. The keypad is rubberized and has a positive feel. The keys are well spaced and fairly large for an HT of this size. The keypad is NOT backlit, but the LCD is. This is intentional, as transluscent keypads tend to desintegrate with time. (Ask any Alinco owner.) The keys have a protective coating, which will prevent the numbers from rubbing off.
I haven't had a chance to spec out the receiver, but will post my findings as they happen. Of particular interest is a sensitivity curve for

the out of band receive. When posted, these will be usable sensitivity figures.

> Anybody ever have a problem with the tnc not working on vhf?

Check the settings, read the book. No reason why it should not work
on VHF if it works on HF. Certainly HF is a lot easier to copy
for the machine. It has to be some setting somewhere. Check the
baud rates, especially.

4958. HELP Please - resurrecting Icom IC-280 & Kenwood TR-9000

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-11 00:00:00 UTC
From: morris@grian.cps.altadena.ca.us
Message-ID: <1995Jun11.001514.20925@grian.cps.altadena.ca.us>
Source record: 216635

I posted this request about a year ago and got no response, but I'll try again, hoping that somebody has something in a file cabinet....

Radio #1 - Icom IC-280
This was Icom's first attempt at a dash-mount or trunk-mount radio -i.e. the front panel detached. I was given one that has squelch and display problems, and would like to pass along to give a new neighborhood ham a "first radio". Does anybody have a schematic or other service info?

Radio #2 - Kenwood TR-9000
My main base 2m radio is a Kenwood TR-9000 all-mode mobile, with a deaf SSB side (the FM side works OK, and the power/S-meter bounces when transmitting in the SSB mode, so I'm assuming it's working).

I'm looking for a manual (or at least a schematic), plus a source of the funny plug that fits the "tone" jack on the back so I can plug in a external PL encoder and a touchtone pad.

What is it written in? Is the source code available. Would it be
as simple as patching in the appropriate commands for the GX instead of
the GXII, or can it not be dissected quite as neatly as that?
I would very much like to get my 757GX working under OS/2, either
using Windows or native OS/2 preferably. I have not seen any source code
floating around for this so I (and I suspect a few others too) would be
interested in attempting this if it is feasible.

4960. Wanted: Info (or manual) for Yaesu FP-757HD pwr supply

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-11 00:00:00 UTC
From: at559@FreeNet.Carleton.CA
Message-ID: <D9zMnz.36s@freenet.carleton.ca>
Source record: 216637

Does anyone have a manual handy for the Yaesu FP-757HD which
was generally sold with the FT-757GX transceiver?
I need to switch my power supply from 220 volts to 117 before I
can use my rig. (I bought the power supply in England). Unfortunately,
I lost the manual with the nice little picture covered in numbers telling
you where to move the taps on the transformer to change voltages (there are
quite a few, I seem to recall).
Can anyone **PLEASE** E-mail me with the info I need, so that I can
get my rig on the air. I am using a home brew step up transformer arrange-
ment right now, and every time I key down, I blow the fuse because the XFMR
ratings are so low.
Any information would be **GREATLY** appreciated.

As a side note, it seems that the tuned input is not tuned too well.
I don't think the 940 likes 3:1 SWR. If you have the AT I would
run the tuner to compensate.

4966. Re: Kenwood TH-22AT mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-11 00:00:00 UTC
From: kingsamson@aol.com
Message-ID: <3rf2oj$5m9@newsbf02.news.aol.com>
Source record: 216643

Yes there is a mod available for the TH-22AT, the mod goes as follows:
first remove your ant., & knobs; pull back the rubber seal on top; then
remove the battery & the 2 screws on back.; Now carefully squeeze and pull
the 2 halfs apart (carefull not to pull any on the flat ribbon cables
inside); now up near the top of the unit you will see 2 little green
wires. One will go to W202, if you cut this wire it will give you the MARS
& CAP Mod.; (no loss of features); The other green wire goes to W201, if
you cut this wire it will give you extended tx/rc, & euorpeon repeater
offset caplabilites; (but you will LOSE your auto +/- repeater offset and
other good features). I have tried the first Mod, But not the W201.
Do not transmit outside any band to which you are licensed, it is
illegal!
Also do not transmit on MARS or CAP Freqs without the proper license!
as always stated this mod is done at YOUR own RISK, and will void your
Warranty. Hope you enjoy this mod.

Hi all,
Hope this is the right place to post this request...I know very little about amateur radio, but browsed r.r.a.misc to find this group. Anyway, my dad's looking for some info, and I thought maybe someone out here could help.

He's got a Zenith Transoceanic Royal 3000-1 (I'm quoting right now :) and is trying to locate either a Sam Fotofacs or Ryders Manual for it... also any logs or charts. In particular, he needs alignment information.

Anyone know of any sources (he's tried some of the obvious ones), or, better yet, anyone have any of these? He'll be glad to pay copying costs, postage, whatever, or offer a FAX number, etc.

If anyone has any info, could you please e-mail me at lashes@netcom.com as I don't read this group regularly. Thanks in advance!

Sincerely,
Nick Macias

Your cross-posting doesn't include any aviation groups. You might
find better luck in finding Bendix-King radios there or at least
a list of dealers.

Source record: 216563

In reference to the megabytes of email I've received about
Pagercom::::::::::::::::::::>>>>>>

I'm not sure where the original question was posted regarding a software program for Alphanumeric Pagers but I posted an answer regarding 'Pagercom', a downloadable shareware program. I have been *swamped* with personal email inquiring as to where to find this file.

It is in the 'Telecommunications' section of the America Online Software Library. For AOL members simply go to the AOL Library, click on 'All Dates', click on 'Telecommunications', type in <Pagercom> for search parameters, click on 'Search'......and, there it is.....More>>>>>>>.........

For those of you on other servers, I have no idea how to tell you to access the AOL Library.......perhaps some sort of FTP process?

The Pagercom rep has two email addresses as follows:

<MarkC43415@aol.com>
<71042.633@Compuserve.com>

As stated before: I am not affiliated with these folks whatsoever.

It is a very nice (and easy to use) windows program. I hope the guys (and gals?) at Pagercom appreciate this rush of PR that I've apparently generated. Perhaps they'll refund my $25.00 registration fee.........
;>)

Please.......find the program or email them directly.......no more email to me.......Thanks.

Source record: 216564

A question from a newcomer to this group (me).

What does it mean when a radio advertises that it is "MARS modifiable"?

After being modified for MARS, is it then legally like a type accepted radio? (My guess is no) I've also noticed that out of band tx mods are possible for radios that don't advertise to be MARS modifiable.

Also, what are the requirements for getting a licence to broadcast on out of ham band frequencies?

Thanks,

Ben

I saw a VERY clean Kenwood R-1000 for sale for around $250.00. Is this radio worth that much? I know its only manual tune with no memory but I guess it must be a good reciever. My main interest is SSB Military Monitoring. I will eventually be getting a better radio with memory but would like something with sideband till I do.

If its in good conditions go for it, $250 is a good price. Some radio stores sell them for $350-399!!! I have owned 2, first one a bought at Dayton 93 for $275 it needed a minor repair to the analog dial. Upgraded to a R-5000 and sold it to tony who is a hardcore aviation utility DX'er. It was his 4 or 5 radio and he raved about it. I missed it and found another on the net for $250. It does a good job on SSB. The sound is nice and full. It is a great radio for SWB and MW.

Hi! I was wondering how much a small, inexpensive UHF radio would cost me. All I need is to have one frequency (453.350) and it doesn't have to be a powerful radio. I currently have a scanner but I'd like something a bit smaller, and more portable just so I can monitor that one frequency. That's the reason it doesn't have to be a powerful radio - just so long as it can recieve transmissions. I don't know too much about radios and stuff so if there are any other options you folks can think of, I'd appreciate them! Even something like a used Motorola Minitor II might do the job. I'd appreciate any advice I can get! Please respond via E-Mail at sachinp@execpc.com. Thanks in advance!!!

4979. looking for telephone style handset for full duplex autopatch

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-12 00:00:00 UTC
From: screa@aol.com
Message-ID: <3rgmlg$jfq@newsbf02.news.aol.com>
Source record: 216569

Hello,
thanks for reading this. I use a full duplex cross band autopatch (2m/440) that will work for full duplex conversations, but the audio feedback I get makes it impossible. What I need is a telephone style handset, with a dtmf keypad that will plug into my dual band radio, without too much trouble, and allow me to make full duplex autopatches. Any suggestions??

Please E-mail you suggestions directly to me
screa@aol.com

thanks in advance.

I think a tech who had certified test equipment and the appropriate class of commercial license (Used to be First Phone, now General) would be on safe ground in using ham or other non-approved radios personally AFTER testing to verify that they met required specs.
He would NOT, though, be able to offer them for sale to the general public. This would definitely require type approval. The user license clearly states that type approved eqpmnt. is required and in many cases requires filing the approval numbers.

Try adjusting VR18 on the Signal board. This sets the min power setting for the external or front panel slide adjustment. I have set mine to .9 watts using a IFR analyzer. This gives me enough movement with the touchy adjustment to get 1 to 10 watts without overdriving external equipment

Don Nutt - KJ6TC

VR18 is located torward the front of the Signal board just to the right center. It is to the left of VR23.

>from what I can tell, but does ne have the advantage in
>overall durability, reception, quality, etc?
> Thanks for any replies.

Basically you're going to get all kinds of answers from people. They are all pretty much all good brands. I lean with Icom as my first HT was a used Icom, and I wanted to be able to use all of the accessories I got for it (headset mike, etc).

I'd say compare the FEATURES. Any special capabilities, like alphanumeric displays for your memory channels, how many memory channels, do they have to share common PL/repeater settings, scanning abilities, out of band receive, user-changeable lithium battery, power output, battery life per charge with various power settings, power-saving settings, how big or small are the buttons, how easy is it to operate one-handed (while driving), lots more.

Then ask other hams about their radios, especially anyone who just got a new one. They can usually give you good reasons why they chose that particular model over something else. My first HT was "here's a great bargain, get it before someone else does" so I did. And it was a good radio, still is. I sold it when I got my new HT.

Where in the world did you come up with this idea? The FCC regs you refer to regarding user licenses also apply to any user license held by your mythical tech! He, as a tech, cannot transmit using non-type-accepted equipment with any more "legality" than can any other user. Period. The FCC regs make no provision for any testing procedures and exceptions such as you describe. Sale to the "general public"? Never heard of such a thing.

The bottom line - do what you want, but be aware of the law and the risks you take by breaking it.

This is not the way it works. No technician can simply certify his/her own radios as being "Type Accepted". Using amateur radios to transmit on non amateur frequencies is simply a violation of the rules. While the rules claim that exceptions can be made in times of emergency, your actions are subject to review after the fact. And plenty of people have been severely punished for using non-type accepted equipment in life and death emergencies. In my volunteer work as an EMS provider, I hear of cases like this across the country. It makes no sense, it stinks, it's terribly unfair. But that's the way it is.

From: au156@yfn.ysu.edu
Message-ID: <3rhj3t$3li@news.ysu.edu>
Source record: 216577

Does anyone have a schematic the following 2 meter amp that he could
make a copy of for me?

Lunar Electronics Linearized Amplifier, Model 2M10-80P.
(I guess that's 10 IN, 80 OUT, with a preamp.)

I bought this used, and haven't a stitch of printed info on it.
It's a little difficult to trace the DS PCB without separating
the two boards from the heatsink, although I have a general idea
of what is happening.

What I would like to do is to disable the SSB linear bias on the
single transistor (SD1416), because the power drain seems to be
excessive compared to a plain old Class C transistor amp. It has
an FM/SSB switch which I always thought took out the bias on these
types of PAs, but It seems to really just effect the T/R relay
lag time.

Incidentally, there is a 10 watt resistor that gets hot as a pistol
when transmitting for any length of time which must be part of the
linear bias network. For ten RF watts out, the power drain is
something like 4 amps instead of about the 2 amps I'd expect for
a plain *FM only* PA.

One question for the group following this thread : what about commercial
handhelds (eg. FCC approved for public safety use) used on NON-amateur
frequencies - BY a HAM operator during life and death emergencies?
I'm referring to handhelds by Moto/Icom/Bendix/etc. that can be used
in the ham bands but will also cover non-ham bands as well.

Bring your own lawyers. I have Part 94, and do believe that I am permitted
to 'emit a carrier' if IN MY OPINION it will not cause any interference.
I
didn't say a word about "type accepting" the radio. I will, of course,
have
to also use the receiver, another issue. I agree that I am subject to
later
review.

>And plenty of people have been severely
>punished for using non-type accepted equipment in life and death
>emergencies. In my volunteer work as an EMS provider, I hear of cases

I would like to hear of a few (or even one) case (with court or FCC cites)
where
suitably licensed people were "severely punished". (Note that I exclude
bystanders, hams, and holders of medical or other licenses.)

I do agree with your assessment about the unfairness of it all, and hope
that since most states have now passed "Good Samaritan" laws such
idiocies will soon disappear. Last I knew, 42 of 48 had them. Does AZ?
It would also be nice to have that provision in FCC regs, but point may
soon be moot if Newt & Company dismantle it.

> KB2Tws

The HTX-202 is a great 2 meter HT. The rig performs well, is easy to use, and I have had reports that my audio sounded great. The receiver is hot as well, with excellent intermod prevention. I purchased it in April from U.S. Radio, in Ft. Worth, Texas for $169 new, plus the extended warrenty (good for a total of 5 years) for a total price, including the rig, of $210.00. They seem to go on sale about once or twice per year. I understand that there may be a dual band HT on the way from RS in the very near future. The HTX 202 and 404 have been hot items, judging from all the chatter about them on this net. I am quite pleased with mine, and would recommend it to anyone who does not need the additional features that come with the name brand HTs. Your price for a used 202 appears high, given what they go for new. The other thing to note is the age and/or serial number of a used 202. The earlier models had some problems which were later corrected, though I do not remember what they were. GL & 73

We use business band radios in the shop (460 and 480mhz)
and I own a dual band Kenwood th-78a with mods.
I could transmit within transmit power and specs (spurious output) and
deviation, but it is not 'type accepted' - I'm not doing anything that
disturbs anyone, and a fcc monitoring station couldn't tell,
only if they actually looked at what radio I was using.
I just doesn't make sense to carry 2 radios around with me,
When I can just use my one HT, and have amateur and WX RX, too!

I don't know about *all* of those things, but if the type-accepted radio
can be programmed to operate at specific frequencies in the ham bands,
you might be able to *carry* one rig, and leave the amateur rig in the
car to monitor weather and other services. That *might* be construed
as no longer being type-accepted for public service, but nobody may ever
every complain or even notice (except maybe your superior). Using a
radio on band it's not designed for may not be a good idea, particularly
if it is technically inferior to what is normally operated there.

I used the S-108 in 1961 when I received my Novice License. First receiver.
A nice superhet. I still have my fist 50 watt xmtr used with the s-108.
Would not mind finding a s-108 for sale to put my first station back
together again. Have fun with it.

STAY AWAY from Hamtronics as rptr equipment....the XVTRs are ok
for OSCAR and ATV use....but the FM TX and RXs are NOT worth
it. For a GOOD rptr, get a GE MSTR EXEC II or MSTR II radio and
use IT for the rptr RF section....then buy a CAT controller or a
USED ACC rptr controller and you'll come out WAY ahead...
(SCOM also a good choice on controllers....Link Comm ok if you
want to link multiple sites)

For one:

Is the RC 96 used on a 2mtr rptr? Legally you cannot
control/operate a remote base using any freq below 222.15 Mhz
(see Part 97 for remote control and AUX stations)

Two:
A ACC RC96 also supports the IC 900/901 series of band modules if
memory serves....I would use THEM instead...the Kenwood modules
cannot be 100% controlled by the Doug Hall interface last time I
looked....

Doug Hall Electronics can be reached at (614) 261-8871...address
is 815 East Hudson St, Columbus, Ohio 43211-1199

I use a RV4 voter at work...nice product....but being a ACC RC850
owner and a remote base operator, I would HIGHLY suggest the ICOM
modules instead of using the DH interface and the Kenwood radios.

From: Chris Boone <72732.2610@CompuServe.COM>
Message-ID: <3rif1rhpj4@mhafc.production.compuserve.com>
Source record: 216589

ACC, SCOM, CAT and LinkCom are the top 4 in rptr controllers
right now...

Depends on what features you want...for basic rptr functions and
autopatch, CAT is the best value....SCOM is 2nd though I do like
Bob's products a little better in a personal sense...

For medium operation of rptr w/patch and remote base, ease of
programming, etc., ACC is best though the cost is not!

For linking (full duplex backbone) and flexibility, Link Com is
good choice though programming is not user frinedly from the
start (I am an OLD ACC RC850 owner and the LinkCom RLCs took a
bit of getting used to.....) oncew you master them, they ARE
flexible.....(yet complicated!)....

Hope that helps...need any more info? Let me know...either here
or drop a note to my Compuserve address or FIDONET 1:106/4267

Source record: 216592

1: Yaesu FT-900/AT $1200.00 Shipping included, COD extra.
HF Transceiver 160 to 10 Meters.
Remoteable Faceplate, Remote kit included.
All Modes (AM, FM, USB, LSB, CW)
- Digital Modes supported via AFSK.
Over 200 memories.
Built-in CW Keyer.
Built-in Antenna Tuner.
Built-in PL for 10 Meter FM.
100 Watt output Xmitter (25 Watts Carrier AM)
Includes Hand Microphone.
13.8 Volt operation.
I have the original Box, packaging, both the owners manual
factory and service manuals, and that little package of jacks that
comes with the rig.
- Includes the following options.
- YSK-900 Remote Mount Kit
- MMB-62 Controller bracket
- MMB-20 Mobile Mount Braket, NEW Never used.
- Also Included is a Radio Shack DSP/Powered Speaker.
- You'll need a speaker if you remote the head anyway, and
it might as well be one that helps with noise too.

2: Kenwood TS-940S/AT absolutly mint.
$1500 for the package, includes shipping, COD extra.
Package Includes -
Custom dust covers,
Installed Filters,
- AM 6 Khz Kenwood Filter.
- SSB 2.1 Khz Filter from IRCI (Both IF's)
- CW 500 Hz Kenwood filters (Both IF's)

Giehl's Firmware update.
(Tunable memories and direct access to all 40 memories)

Kenwood MC-60A microphone.
Kenwood SP-940 Matching speaker.

HF Transceiver 160 to 10 Meters
All Modes (AM, FM, USB, LSB, CW, FSK)
Built-in Antenna Tuner.
100 Watt output Xmitter 100% duty cycle allmodes.
110 Volt AC power source.

- I have all the original Boxes, and packaging,
and the owner manual.

- Will sell the RIG only, NO filters, NO Speaker,
NO microphone for $1200 plus shipping.

2A: Kenwood SM-220 O-Scope with BS-8 Pan-Adapter $300.
Will only sell after I sell the TS-940S/AT.
I have the original Boxes, manuals and accessories.
Price if purchased with the TS-940S/AT is $150.

3: RF Concepts 2/70G
2 meter / 70 CM linear amp with receive pre-amp. $200.
This is made for use with an HT. Has BNC's in and out.
Great receive pre-amp.
- Will swap for/toward late model 2 Meter mobile,
TM-231, TM-241 or Yaesu FT-2400, ICOM whatever.
No Alinco, or Azden.

4: A brand New, in the original box, Linear Amp.
$350 Shipping included/ COD extra.
All Solid state. Uses Qty four 2SC2879's.
Works on 1.5 to 30 Mhz, but lets be honest it
was built to be a CB Linear, but let me tell you
it mates great with the Ranger, Uniden, or Radio Shack
10 Meter rigs. But will also work great with 40 watts of drive
on 1.5 to 30 Mhz. Will work great with the FT-900/AT above.
Except for checking it out I have never used it.
Brand name is White Line 500. Also sold by the name
Texas Star "V500", Has variable output control so that
you can set the amount of output from about 50 Watts to 500.

From: Brett Coningham <ab5p@swcp.com>
Message-ID: <DA2yr8.A03@swcp.com>
Source record: 216593

May I suggest also, that you consider using an ICOM IC-2AT? Some
of our T-hunters use them and have found them to be able to
run forever, without overheating, on a 30-second ON/OFF cycle.
I've seen them go for $75-100 at hamfests.

For what its worth, I also use a Hamtronics 2m transmitter board
and found it to be dependable in varying weather conditions, for
our T-hunts. I run mine at about 1 watt output, and use attenuators
to cut the signal even more, at times.

Looking for the following relay:

Potter & Brumfield R10-E1Y4-J10.0K

This is 4PDt current-actuated relay with
a 10,000 ohm coil. Also need socket.

This relay will replace a P&B MH-3665-1
relay with similar characteristics,
manufactured for Hallicrafters in 1958
for use as a changeover relay in the
HT-32A.

Obviously, a MH-3665-1 would be just
fine too!

Socket also need if appropriate.

Thanks!

> Thanks for any replies.

I have owned both (HF rigs,) they are both equally good in quality.
The only problem that you might someday face is having your
rig serviced for one reason or another. I have found that Kenwood
is MUCH slower than ICOM on their service turnaround time. I have
had no manufacturing related problems with either, the only problems
have been things that I have done to them (ie dropped, lightning...)
Other than that, look for price and features that you want on
either rig. I agree with glyle@thor.seas.ucla.edu (George Lyle (233789)),
he writes that Yaesu has much better manuals than either.
Most of my equipment is Yaesu.

5014. FT-990 Firmware Version?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-13 00:00:00 UTC
From: wa8msf@aol.com
Message-ID: <3rknav$j7f@newsbf02.news.aol.com>
Source record: 216509

I have an FT-990 that doesn't seem to work with either of two rig control logging programs from different authors. My FT-1000 works well with both programs, while the FT-990 sort of locks up during certain phases of the polling routines. The frequencies reported are quite bizzare on the '990.

I have heard that there are different firmware versions that could cause this sort of incompatibility.

BTW, I am using the FIT-232 and the same cable when switching between the FT-1000 and the FT-990.

Anybody have a bigger clue about this than I?

All resposes grarefully accepted.

A caveat on S-Comm which applies to the 5K model - there is a bug in the software which causes the reset of the timeout timer to occur at carrier drop regardless of the setting of the reset timer (which controls the courtesy beep). So if you set a relatively long courtesy beep timer to encourage users to wait for the beep before transmitting, lest they get axed by the timeout timer, it doesn't work! They can jabber back and forth all day without waiting for the beep and they won't get timed out.

I had noticed this operation on our repeaters for some time and finally called S-Comm about it. Bob admitted the bug and said it had been fixed on the 6K, wouldn't be fixed on our old MRC-100, and might get fixed on the 5K. That was a couple years or so ago. I contacted them again a few months ago and was told there were no plans to fix the bug for the 5K.

I have no complaints about S-Comm products other than their attitude regarding this bug. If you don't care whether the reset timer works, the 5K is a good product. Personally, I'll recommend we shop elsewhere should our club need a new controller.

: There is only 1 mod for the 2500, regarding opening the tx to 140-174 Mhz.

Interesting. Though I have no interest in doing this mod, is this applicable only to the European versions or is it also applicable to the US versions?

Source record: 216515

Does anyone know if the HX 1681 10-80 meter CW transmitter requires
a seperate power supply? I'm waiting for manuals to build the kit,
and I noticed on the back panel there are inputs for various
voltages from 12 to 800 volts. Can it not be plugged directly into
AC current @ 110 volts, or 12 volts DC?

I don't want to spend the time to build this xmitter of I can't find
a power source for it, or if it has to be linked into it's sister
receiver.

Thanks in advance. I may be reached here on this echo, or at the
following Inet address.

: Thanks for any replies.
: Casey N. Brown
: gsi0233@gsaix2.cc.gasou.edu

After reading most of the responses I didn't see anything that was a personal comparison. I've got both, in fact more than that, and they both work well. I have noticed that there is probably more rejection on the Icom than the Kenwood. The Kenwood's display is better and the durability of the Icom may be a little better. The Kenwood has some features that I like better and the Icom has a better audio quality on tx. The Kenwood has better quality audio on the rx.

There was one suggestion that I spotted, take the two or three models and use them at the same time to make a personal comparison. That's about the best suggestion that I read.

Good luck,

Niles

From: Bryan P King <kingbp@delphi.com>
Message-ID: <ZU9eNlq.kingbp@delphi.com>
Source record: 216523

I've owned a Scout since Christmas 1993 and have been very pleased with it. There has been only one problem with it and Ten Tec promptly resolved it. The PTO started to flutter and it was close to the end of the warranty period so I decided to replace it.

I've worked alot of DX with this rig in the past few weeks on 20 and 17 meters. Everyone comments on the fine audio quality!

For an affordable rig its your best buy for the money. It is great for hams who are just starting out and don't want all of the extras that come with a fully loaded xcvr.

Switching bands is not too difficult with the modules. I usually stay with one band for a while and decide to switch when conditions drop out. So its not too much of an inconvenience at this point.

When I decided to get back into HF after a 3 year hiatus, the Scout was just what I was looking for. Prior to that rig, I owned the Ten-Tec Century 21.

I've had very good experience with Yaesu factory service. I've sent in several ht's (411, 811, 530) over the past couple years for both in and out of warranty service. The turnaround time was about 3 weeks, and the cost for out of warranty service was VERY reasonable ($40 for an IC replacement and general tuneup, for example).

>Hugh VE3DCE in Ottawa, Canada

It is written in C. The problem with the 757GX according to my
documentation is that this model does not return any information such
as frequency. This makes it impossible to read the programmed
frequencies and s-meter. These to me are major functions. The data is
only one way and that is to the radio. With the 757GXII the data
became two-way. About the best that can be done would be to store
bands of 10 channels of info into files. Then send these files to the
radio to program these 10 channels. I think there is a DOS based
program that already does this.

Wish I kept notes sufficient to fulfill your request. But not being of a legal
frame of mind, I haven't saved such details. What I've referred to are
accounts told to me by the people directly afflicted. These included in one
case a volunteer agency operating either on licensed freqs but with ham gear,
or operating on another agencies freqs with its permission. A local govt
agency of my acquaintence was severely fined and equipment confiscated for
using ham gear on public safety freqs for wich that agency was licensed.

Yes, AZ does have a Good Samaritan law. But it is not intended to address a concern such as FCC regs. The basic concept is that if you provide emergency medical care within the limits of your training, you may not be held liable.

Rusty,

The Brown Brothers Paddle is great but I haven't seen one advertised in
years so I doubt if they're still made. They were made in St. Louis,
Mo. as you said. I've had mine for probably 25 years. Though I won't
part with mine, maybe you could find a used one.

>
>- Cliff

In this case you just get into the matter of treading on frequencies for which you are not licensed. If the radio you use has Type Acceptance, then Type Acceptance is not the issue. You must still face the possibility of being held accountable by both the agency whose frequency you used, and the reaction of the FCC. People have been punished by local jurisdictions for messing with their departmental frequencies, regardless of the circumstance. This sort of a reaction seems to be more likely in urban jurisdictions, less so in rural areas.

Source record: 216535

I hope someone can help me with this. I have a Kenwood TS-850S that I'm trying to get on HF packet with. The TNC I'm using is a PK-232MBX. I am using the ACC2 plug at the back of the radio. With the PK-232 connected, the audio is distorted. Kenwood knows of the problem and there is a service bulletin on it. What's happening is the audo output level from the TNC is too high and causing overload of the microphone amplifier circuit. Has anyone overcome this problem without modifying the radio? I've tried a voltage divider in the audio line from the TNC using to pots., and adjusted the both to try to lower the audio level but that didn't help.

Please e-mail to Clinton.Peebles@saloon.bcbbs.net

Thanks.

5041. Advice od SW radio and shop in California sought

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-13 00:00:00 UTC
From: mike@moocow.math.nat.tu-bs.de
Message-ID: <MIKE.95Jun13152600@moocow.math.nat.tu-bs.de>
Source record: 216536

I live in Germany and am very peeved at not being able to pick up the BBC World service at all well on my Grundig radio, even though Britain is only a few hunderd miles away. In a few weeks I shall be travelling to California and would like to buy a decent radio. Two important questions are:

1. What is a good radio to buy?
The radio does not have to be small, or particularly portable. I would be quite happy with large, solid, radio that has excellent reception qualities that can be significantly enhanced by the use of an external aerial. (This is why the Grundig is a heap of junk; although there are various ways of attaching an external antena to it, doing so actually degrades the quality of the reception, as Grundig later even admitted. This is also why I don't want to buy another radio in Germany.) As a New Zealander, an added bonus would to be able to pick up New Zealand occasionally, but that might be too much to expect. A few years ago, the American Drake radio was said to be one of the best, is that still the case?

2. What is the address of a good shop in California, where the staff are competant, and the range wide. We shall be landing in Los Angeles and leaving three weeks later, so Los Angeles might be the most suitable place to buy a radio, but I would welcome any suggestions.

Thanks in advance,

Mike Dowling

HELP

I need a source for replacement components for AC Delco components
used in General Motors automotive accesories (Radios, etc;).

If you know of one, or have a cross reference, please reply.

Thanks

5046. WANTED: info on ALINCO

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: fishern3485@cobra.uni.edu
Message-ID: <1995Jun14.080607.44701@cobra.uni.edu>
Source record: 216450

WANTED: manual for Alinco DJ-500T dual band HT.

I just shocked myself in being able to identify a bad VHF driver,
and since I don't use UHF very much yet, and since they use the
same type of driver, I was again shocked that I was able to
remove the bad driver, and move the UHF driver into the VHF
pads. Now of course I need a replacement driver to get my UHF
half working properly. (but no rush)

Sadly, the only markings on the surface mount transistor are:

```
----- _
! R H !_> It's a VHF driver, driving a dual module.
,--! !_ Module output is 5.5w uhf, 6.0w vhf at 12v.
! ! !_> This transistor is about twice as wide and
'--! !_ twice as high as a typical surface mount
! 8 Y !_> transistor.
-----
```

If you know where I can match a part number to this critter, or
have/know of a manual for the DJ-500T, please let me know. Thanks!

Also, if you have a 'trahed' Alinco, perhaps it has a similar
driver in it - check and see - I might be willing to buy it for parts!

thanks!

5047. Need KW TM-742A Mod Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: arthur@kingcrab.nrl.navy.mil
Message-ID: <3rmqje$pdv@ra.nrl.navy.mil>
Source record: 216451

I have a Kenwood TM-742A with the 'DC-to-light' wideband receive modification. However, when I tune around in the new 0.8 - 1.0 GHz sub-band, all I hear is white noise from the AGC running wide open.

A previous posting to this news group mentioned (but supplied no details regarding) an internal antenna connection which has to be made before this band will work. Does anyone have any information on this mod?

Thanks, George, N3NJM

Internet: George_Arthur@kingcrab.nrl.navy.mil

5048. Need KW TH-78A Mod Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: arthur@kingcrab.nrl.navy.mil
Message-ID: <3rmriq$pdv@ra.nrl.navy.mil>
Source record: 216452

I have a Kenwood TH-78A with the ARTsci wideband
receive mod. Presently, it is possible to toggle between
AM and FM on the ~300-400 MHz sub-band by holding in the
VFO button and then turning on the power.

On the main VHF band, however, it automatically
switches to the AM demodulator when tuned to any frequency
below 136 MHz. My question is, does anyone know of a way
to toggle between AM and FM in the main VHF band so that
wide-band FM broadcast stations could be (admittedly
poorly) received?

Thanks, George, N3NJM

I have one and like it quite a bit. Very small, too. Bear in mind that:

-You need to experiment with antennas, depending on your needs and location. The stock one (little duck) may or may not be enough.

-If you run at 5w all the time, get a spare battery, as when they run out at high power, they go more quickly.

Surprisingly good intermod, and decent audio for such a tiny speaker. Doing the extended range 'mod' was a little adventure but quite successful. Have tiny Phillips screwdriver, a good magnifier, and a vacuum desolderer if you wish to do it yourself.

I use mine around town (Amherst, MA) and with our club repeater autopatch, it's like having a little cell-phone (albeit for non-business calls). I work my friends simplex quite well too.

Unless you are very well located for your needs, I definitely recommend the 5W version.

Good luck.

5053. Astron RS-12 Power Supply Question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: cbean@kruncher.PTloma.EDU
Message-ID: <9506141552.AA18713@kruncher.ptloma.edu>
Source record: 216457

I just recently purchased an Astron RS-12 13.8vdc 9A power supply from the local HRO. The package did not come with documentation, just a schematic of the power supply and some advertisements. I use the power supply to drive my 30 watt linear which only requires 6A. Is it safe to hook up a this 9A power supply to my linear and my handheld without risk of damage to either unit? I ask because I am not sure if this power supply can supply UP to 9A or if it forces out 9A regardless. I don't want to kill my ham gear.

Much thanks...

For the 8-bit enthusiast or computer historian, best offer for:

Atari 1200XL in original styrofoam packing and instructions
(cardboard carton is lost)- still works but power on LED doesn't
want to light sometimes with TV RF adaptor and DC power supply

Percom 5 1/4" SS/SD drive w/daisy chain cable/still works

Seikosha 550-AT tractor feed printer - needs new ribbon cartridge
(have old ones) w/daisy chain cable

Cartridges: Atari BASIC, BASIC XL w/manual(the BASIC they should
have put in the Atari in the first place), Star Raiders

Discs: Atari DOS Version 3.0 and 2.0, Atari translator
(makes 1200XL run like an 800), Smartdos, DOS XL, OS/A+,
Visicalc w/manual in original box, three or four discs with
public domain stuff + box of blank 5 1/4" SS/DD discs

Cassette: Eastern Front 1941

Books: De Re Atari(this is a good one), ABC's of Atari, BASIC
Exercises for the Atari, plus some Atari magazine articles

Tell me more!

I have both '202 and '404. Excellent radios.

If RS made a dual-bander on the same chassis, I'd buy it. An Icom 24AT
is what I carry around with me, and it's not much smaller than the RS
single-band. Out-of-band reception is nice for wx and some marine
channels. But the Icom is fragile. OTOH the '202 has taken a 1.5-meter
drop onto concrete, cracked the AA battery case, but that's it.

Your Astron RS-12 is a constant voltage power supply. This means that it will attempt to maintain 13.8 volts across whatever load you present to it. It will be able to present 13.8 volts across any load up to 9A, once you go over 9A draw, the voltage will drop rapidly. You should not worry about hooking up multiple 12V units to this type of powersupply unless the combined current drain (hence load) is more than 9Amps.

I'd be interested in hearing what the repeater trustees out there
think is the best radio for the value to convert to a repeater.
Or is there something out of the box that works well and doesn't cost
an arm and a leg.

You hear a lot of Micors and MastrII's out there, how do you like them?
How about these Radius repeaters? Can they go down to 440? Are they
worth a darn? Other brands...Uniden, Standard, ???

I'm looking to build a simple, but good and reliable small repeater (10-20 watt)
for maybe $500 or less (excluding duplexer) and would be very interested
in all opinions.

The old Prog line unit we have isn't going to cut it...

The only difference between the versions is the supplied battery pack, so if you
make the wrong decision you can just buy the other pack!

My wife uses the low-power version and it does quite well in our canyon-infested
area. Most of the time she runs on the lowest power setting.

Keep in mind that your 150 memories drop to 70 if you use the memory-naming
feature. Still a lot, though!

Another minus is that the "battery case" (that takes standard AA batteries) will
not charge NiCads if they are installed. It is meant for Alkaline batteries only.

I like to use the "battery cases" as the cost of replacing AA NiCads is much less than the cost of replacing factory batteries. You are also assured of having replacement batteries available when your NiCads die (and they will!)

On my Icom W2A, the difference is:

Replace six 850mAh AA Nicads: $18.00
Replace 1000 mAh factory sealed battery: $75 from Icom, $45 or so from Periphex.

I almost nixed the FT-11 because of its lack of charging ability, but my XYL loved it. She won't let me play with it now!

George

It shouldn't cause any problem as the power supply only puts out the current demanded of it by your equipment.

As long as the regulation is good (and it should be), you can hook any number of radios to the supply as long as you don't exceed its continuous current rating.

My Icom supply came with three DC outlets on the back in addition to the proprietary cable to my HF rig. So far two of them are in use. Unless I get the urge to key down on three bands at once the supply can easily handle the load.

What about using my TS140 with the out of band mods to use in the
4 to 8 Mhz region as the basis for a 2 meter all mode transverter.
Would that be legal as long as I am not connecting the 4 to 8 Mhz
to the outside world (just the 144 to 148 output from the transverter).
I would of course be adding filtering to ensure cutting down everything
except for the frequency of interest. Some folks have told me that
this would be illegal since I am not licensed to use voice/data/etc
on the HF rig, but since I would only ve using it as an overpriced front end
for my 2 meter operation, I think I would be alright. If not, then
how is it that so many people have HF rigs that have 9 Mhz IF sections,
after all 9 Mhz isn't a valid ham band (the last time I looked).
Thanks

I had one and sold it to purchase the FT-51R. The 11R is a great radio.
I have read the responses concerning the poor audio. I personally
didn't think that the audio was bad. I liked the full size lighted keyboard
on the Yaesu. Soooo... Poor audio..... Poor Keypad??? They all have
their ups and downs. There are some undocumented commands you
can enter to change some of the audio settings that supposedly make the
audio sound different. I don't have them I have just heard that they exist.
If Yaesu does change the speaker, that would be very easy to replace
yourself. I have had three Yaesu radios and have never had a problem
getting Yaesu to fix something I thought was poor. These have never
been radio defects, just personal preferences. If they come out
with a better speaker and that is the only change, I would bet you could
get a new one out of them.

Source record: 216473

One more thing... If you buy the five watt version, it comes with
a completely different charger than the 2 watt version. In other
words, the wall charger is different for the 4.8V and 9.6V batteries.
W & W Associates make a quick charger that will charge the entire
family of batteries for this radio. 4.8V, 7.2V and 9.6V. I have one
and like it very much. The 9.6V batteries drop fast regardless of
what power level you're using. You can get a third party 4.8V,
1500 mAh battery that will output 2 watts for considerable time.

Hi All,

This is an UPDATE to my last message of selling all my HAM gear.
Many things are sold.
There are still a few items left though

Thanks for your interest,
Travis
N0VKV
Cedar Rapids, Iowa
(319) 396-1309 (I will return any messages).

please call, as I don't read my email much.

Here's the list:

SOLD YAESU FT-107M HF Transceiver (circa 1980ish)

SOLD ICOM IC-720 HF All Band Transeiver (circa 1985ish)
General Coverage Receiver

SOLD ICOM IC-3230A Dual Band 144/440 25 watts.

SOLD KENWOOD TM-241 144Mhz 50 watts.

SOLD KENWOOD TH-28A 2meter Handytalkie

SOLD CUSHCRAFT A270-10S 144/440mhz Dual Band Beam

Still Available are:

AEA PK-232MBX Multimode Packet Station
Packet, CW, RTTY, Fax, etc.
Bought new about 3-4 years ago.
Have manuals and cables.
AES Catalog lists new regular price as $399
Asking $200

HYGAIN HAM-IV Heavy Duty Rotator with Controller
Bought new last fall.
Has rotated about 10 times.
Only one winter outside.
AES List price $379
Asking $300

CUSHCRAFT A-3S 10,15,20m Beam
New last fall.
Only one winter.
AES list sale price $350

Asking $300

ROHN HBX-48 48 foot Heavy Duty Freestanding Tower.
Bought used about 2 years ago.
Cleaned and painted.
You will need to buy 3 new legs to install in concrete base.
(I believe they were $48 when I bought 2 years ago).
Have technical specs/manual.
AES list sale price $499.
Asking $200.

ALSO Micellaneous items
140 ft of Belden 9913 low loss coax in 4 sections with connectors.
2 dumb terminals (1 works, 1 don't).

5074. US price of HTX 212?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: tcalof@minet.gov.mb.ca
Message-ID: <tcalof-1406952147470001@dial057.mbnet.mb.ca>
Source record: 216478

In Canada, the Radio Shack 2m mobile HTX 212 sells for $399.95 + 14%
taxes. (Ouch!) Could someone post the US Radio Shack price. I saw the 212
at the local store, and was fairly impressed by its apparent simplicity.
However, I don't think it's worth $456 Cdn. 73/ Terry VE4UC

As far as I know, Bill, this applies to the US and Canadian versions. I
can't speak for the European or Asian versions. I got this info direct
from Yaesu technical support.73/ Terry VE4UC

5076. What makes a good UHF repeater?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: cvictor@tuna.hooked.net
Message-ID: <3rofvs$1q3@tuna.hooked.net>
Source record: 216480

THe best repeater maker for cheap $$$'s are GE MVP radio's. Clip one diode and bingo instant repeater. 10-25 watts out.

ANother choice are Micor's. ONLY the 45 Watt version tuned to 35-40 watts will run for ever. Put chassis mount BNC on fromt and run to the recvr and you got a good ol' unit for $40.

Of course you could go by a Motorola C64RCBXXXX commercial UHF repeater for $1500 or so, but start with the MVP's first.

Hi,

KC5EGG Jerry here looking for a few items that might be hanging about the shack. All are Yaesu accessories. A mobile mounting bracket MMB-31 for the old FT-290 not the newer FT-290MKII. One or two MMB-37 brackets for the FT-5200 main body and a YK-1 or YK-1L remote mount kit for the FT-5200. If you have any of these that are surplus please drop me an e-mail. I can buy any or all of them new but if you have them and don't need them they can turn into useful cash.

73 de Jerry

5079. Kenwood TR-2500 LCD woes...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: pazar@sr.hp.com
Message-ID: <3rlhhj$qj9@canyon.sr.hp.com>
Source record: 216537

Fellow Yams,
The LCD display on my TR-2500 2 meter Kenwood HT has been slowly
going 'bad' for sometime now. The same thing seems to happen to
most of these rigs (based on conversations with other hams).
Has anyone been able to (1) get a replacement, and (2) get
Kenwood to admit that there was a problem with their displays
(and maybe even supply a replacement)???

I went through the same thing with my Kenwood 2400, and spent
the $45 to buy a new LCD. I installed it myself.

Last question. Does anyone have a contact in the Kenwood
organization that I can discuss this with? The only contact
I've ever had is with the parts supplier in S. Calif, and
they couldn't (wouldn't) give me a phone number of someone
that could help.

Thanks!

5080. Kenwood R-599 - Instability / oscillation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-14 00:00:00 UTC
From: jptaylor@earth.execpc.com
Message-ID: <3rlk7p$ksq@homer.alpha.net>
Source record: 216538

I have a Kenwood R-599 that has not been used for over a year. I now find that it has developed some intermittent instability which seems to be mechanical (VFO area) in origin. There also appears to be some oscillation, which seems to drift through, which may be related.

Has anyone else run into these symptoms with this receiver model?

Thanks...

Jim Taylor, K9JT
jptaylor@execpc.com

5081. Heathkit 2036A

From: ke6zc@netcom.com
Message-ID: <ke6zcDA5CBw.1H9@netcom.com>
Source record: 216543

I'm planning to buy a small pickup truck (new) in the near future and I would like to use an HF transceiver (Icom FT-900) in it. I would like to know if any particular brands and models have problems either with hard to suppress ignition noise getting into the receiver and/or the transmitted RF causing problems with the pickup's operation.

The two pickups I'm most interested in the moment are the Ford Ranger XLT (or equivalent Mazda) with the 3.0L V6 engine and the Toyota Tacoma with the 2.4L 4-cylinder engine. So I'm particularly interested in hearing if anyone has experience, good or bad, with either of those combinations. I intend to have air conditioning, which may cause additional noise.

I was at Ham Radio Outlet where the salesmen were all complaining
about the lousy speaker and therefore very poor audio at high
volume the FT11 and FT51 (2 meter brethren?) had. Side by side
comparison of TH79 and the ICOM offering, demonstrated that the
Kenwood sounded the best, ICOM next, and Yaesu audio becoming
very distorted due to the inadequate speaker or poor design of
the case. The feature set sure looks good .. and they did
comment on Yaesu possibly reworking the speaker in newer units.

I use a Kenwood, and so do most Amateurs I know, some say that
the Kenwood receiver is better than the Icom.
I have never used an Icom so I don't speak from experiance about
the Icom, but the Kenwood is a fine peace of electronics, I'm very
happy with it, and I can't find a reason why anyone with a Kenwood
would ever considere switching to another brand...

OK

>Does anyone know where to buy such a transmitter? I understand you
>can buy a nifty little semi-conductor such as a Gunn diode, but these
>damn things are difficult to tune correctly in an enclosure. They
>also require special equipment that I do not have available.

So you want 10 kilowatts, but you don't know how to tune anything.

>I have heard that a person can purchase a device called a Gunnplexer,
>which is used to activate intruder alarms and automatic doors - it
>transmitts on 10.525 Ghz and is really the first step of what I need.

Gunn diodes don't do much beyond 200 milliwatts. At this power level
they are unaffordable by consumers.

>This device must be able to create "harmful" interference on X and
>K bands...Of course, this will only be used in a lab setting (HA!)..

>Any advise, comments?

Get a life? Find Love? How about volunteering at school to help the
disadvantaged students get ready for high school? Teach someone
to read?

Advise is actually spelled advice.

Thanks, Tedd. If your price is $350 US, why in the world would anyone buy one, when, for similar $, they could get an IC281H which includes 440 rx, data jack, and mega memories? Does anyone else think this rig is overpriced at $350 US?

5095. Keep Me from Frying My Acura with RF

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-15 00:00:00 UTC
From: geoffs@onr.com
Message-ID: <3ro35d$ku5@Sierra.onr.com>
Source record: 216403

I've had two mobile HF installations in the past but now have an Acura Integra that's got more electronic controls in it than an F-16 (well, maybe not quite that many).

It's going to be a challenge forging and welding up a rear mount for the Outbacker I'm planning to use but I'm more concerned about stray RF loops upsetting (or destroying) the various electronic systems in the car.

Experience has shown me that connecting power leads directly to the car's battery minimizes alternator whine. Any opinions on the value of using a common-mode power line choke, as well, to keep RF currents stricly between the RF output of the transmitter and the antenna system?

I've heard horror stories about high-powered transmitters wreaking havoc in the newer vehicles. Got any that you'd like to share?

I sure miss my 1979 diesel Rabbit. It was slow, noisy and smelly but what a mobile platform!!

The Brown Bros. keys are no longer manufactured. Too bad, they are nice.
They can be had on the used market from time to time.

I own and use a number of good paddles - Jones, Kent, G4ZPY VHS,
Bencher, and Vibroplex, and others. The only one I don't like is the
Bencher. I'm in the minority on the Bencher, but I just don't care
for the feel of the thing -- lacks solidity. The one I use most often is
the Vibroplex Iambic (not the Brass Racer). The Vibroplex Iambic is a
very fine key that is responsive, easy to use and nice to look at.

Your are correct that part 94 (Private operational fixed microwave service)
does not have the same type acceptance requirements as part 90 (Private land
mobile radio service). Most of the concerns over out of band operation in
this group are when hams use modified equipment on frequencies allocated to
part 90 and in some cases, 80 (Maritime) or 87 (Aviation).

Don't waste time arguing over an apples and oranges comparison.

These issue are covered in the the FCC rules. For example 80.311, 87.43,
87.397, 90.407 and of course our infamous 97.403 and 97.405. These sections
(not all inclusive - just sections from parts I have an interest in) offer
station licensee's and pretty much any operator authority to deviate from
the rules under emergency circumstances in one way or another.

I too would like to see some DOCUMENTED cases with references where even
unlicensed individuals were severely punished for bonafide emergency
operations. All I have been hearing is "..it happens all the time.."

-What about using my TS140 with the out of band mods to use in the
-4 to 8 Mhz region as the basis for a 2 meter all mode transverter.

Perfectly legal (assuming you have a Tech license or higher...) since you
are not transmitting HF (any more than using a signal generator would be).

-I would of course be adding filtering to ensure cutting down everything
-except for the frequency of interest.

Probably better to use a higher frequency on the HF rig to make it
easier to filter out the mixer product you aren't interested in, but that
is a technical issue, not a legal one.

Avoid the Unidens, Yaesu/Vertex, ICOM, the (ewwww...Radius -
even Motorola makes crap) and other Japanese equipment
- especially if you want reliability AND are operating from a
severe hilltop site (heavy RF saturation and temperature
extremes).

The Micor is a good radio, but they are certainly getting on in years,
and god knows Motorola hasn't made them since perhaps the early 80's.
Parts can be hard to find. (Of course, if a clean, working one fell
in your lap, use it).

MastrII's have a good reputation. I do like the Moto. Mitrek.
Not modular like the Micor, but newer, easy
to duplex and smaller and lighter. The Mitrek only has 2
problem areas, that is the audio/interface board needs to be pulled
and the contacts cleaned (this is the board that the front panel
connector is affixed to) and the solder should be reflowed at the
bottom of the UHF preselector/filter prior to tuning it (requires
a high power, 300W Weller Gun, or two people with 100W irons
attacking each solder point at the same time. This solves
"Intermittent Audio" and Intermittent RX sensitivity problems.

Communications Specialists will sell you a PL decoder with a
kit that allows you to plug it in directly to the radio's PL/DPL decode socket.

Like most radios, if they are in the 450-470 MHz band, they will tune to
440 without a problem. You can buy these radios for no more than $450
all day long, and converting the channel elements to your frequencies
will cost about $70.00 per frequency pair from International Crystal
in Oklahoma City (includes the optional "compensation and deviation"
alignment).. which is the ONLY crystal house that I'll use... you
supply the old channel elements which they install the xtal in.

However, if you have a site that does not require a bulletproof radio,
then some of the other "out of the box" alternatives may work fine for you.

OOPS...guess the guy was looking for the paddle, not a keyer. Brown Bros has been out of business for a long time. As a former resident of St. Louis (home of Brown Bros), I remember Ham Radio Center (also now out of business) was carrying some keys MADE BY BROWN BROS but with the Ham Radio Center "name". I picked one up at a hamfest in Dallas a few years back. The paddle and keyer ran about $US 60. Perhaps you can find a used one.

Or, try some other paddle mfg's such as: Vibroplex, Bencher, Nye Viking, Hi Mound, Kent, Palomar, etc.

Good luck and 73 de Joe BV/N0IAT Taipei, Taiwan Republic of China

No Heath has left us in the cold. No more ham kits I'm going to
miss building there kits. I have about 20 kits .

There are a few kit supliers out there one is Ramsey there number
is 1-800-446-2295.
There fax is 1-716-924-4555

good prices but now where near the construction of a heath.
Hope this helps 73... Bob WA2IHJ

Yeah..CTCSS costs an extra 90 dollars canadian, and the battery
warning rings 2 seconds before the radio goes off. I think the size
and the power make up for this though.

[A newbie asks for a 10.525GHz, 10KW continuous-duty transmitter. It should be "capable of producing harmful interference". He also wants to transmit up on the K-band too.]

Once we find this loon his dream transmitter, who's going to volunteer to help him get it running? Do you think it would be amusing to have him stand in front of the antenna while you tune for resonance? Should we consider an environmental impact statement, in view of all the dead birds that are likely to pile up nearby?

I just hope he's nowhere nearby when he turns this thing on.....

Summary:
Keywords:

FOR SALE INTERMOD FILTER (ATTENUATOR)

The Attenuator is a specially designed filter for use with Handheld Radios or Mobile Radios. It is perfect for HT with mobile or base antenna that has a lot of intermoduration. This Attenuator removes intermod signals such as another repeaters, pagers, or cellular phones. There is a sensitivity adjustment allowed local noise level to be virtually eliminated. Unit installs between antenna and receiver. Automatic bypass when transmitting (up to 50W). Requires 12 VDC.

Hi Mike,
Heathkit does not produce amateur radio kits any more. There are other outfits around who do produce kits, but mostly QRP or VHF/UHF. You can find their adds in the different Pubs, QST, 73, CQ, etc.
Good Luck...

FOR SALE:

All items guaranteed operable and come with owner's handbooks or
service manuals and a DOA guarantee unless otherwise stated.
Buyer pays shipping, handling and COD fees if preferred. Please
email or FTSC replies as I am often out of town on business:

RADIO SHACK DX-440 SHORTWAVE RECEIVER $115.00
New condition, unused.

RADIO SHACK DX-370 SHORTWAVE RECEIVER $ 40.00
Good condition.

RADIO SHACK HTX-100 10 METER TRANSCEIVER $115.00
Has three small holes on bottom cover which
are not visibile unless the transceiver is
turned upside down. Otherwise condition is
excellent.

KENWOOD TS-130S MOBIL HF TRANSCEIVER W/VFO-120 $425.00
Nice early model compact mobil transceiver
which cab be used as a base station. Includes
WARC. Owner's and repair manuals.

KENWOOD TS-520SE HF TRANSCEIVER $390.00
Solid state with tube finals, tolerant of SWR.
WARC coverage.

TEN-TEC OMNI-D HF TRANSCEIVER $475.00
Excellent beginner's HF rig. High durability,
reliability, and low weight. 12V for mobil or
contest use and comes with 20A power supply
for base use.

RG-213 (RG-8 EQUIVALENT) NEW COAX, BUILT FOR $ .28/FOOT
military use and to military specifications.

WINTER 1995 QRZ! CDROM $ 10.50

HAYES 28.8 VFC MODEM $250.00

CENTRONICS 4-POSITION SWITCH BOX $ 12.00

DB9 4-POSITION SWITCH BOX $ 12.00

RS-232 4-POSITION SWITCH BOX $ 12.00

Wanted to buy. Will consider in trade or by open purchase:

ALINCO DR-570T IN GOOD TO PRISTINE CONDITION.

MFJ-259 OR EQUIVALENT SWR ANALYZER WITH RF GENERATOR.

PK-232 OR EQUIVALENT PACKET CONTROLLER WITH WEFAX.

>[snip!]
>The GMRS license fee is $35 for five years (I heard the
>fee may have been increased though).
>[snip]

It has indeed increased, effective January 2. According to the information I just received from the FCC, the new fee is $80 for new license or renewal, or $45 for a modification. Note that from 574 is still used for GMRS, but for 600 has superseded it for other land mobile applications.

>clint Bradford (clint.bradford@woodybbs.com) wrote:

>frequencies. (And don't even offer : 462.675 - the
>nationally-recognized Emergency frequency).

RS has a new GMRS HT which seems similar but not equal to the Maxon 210+3. It has 10 channels - interstitials, 462.675, and two which are user programmable from among the remaining GMRS frequencies. It's output power is either 2W or 0.9W. Unfortunately, it does not do CTCSS and I could find no evidence of repeater support (I really hope I just overlooked this one when I was browsing the manual, else what is the point?) It costs $219, and my local Shack reports that they are selling fairly well as such things go.

This is better, but the Maxon still looks like the superior choice :-)

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

5122. Recommend a text on basic electricity and radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-15 00:00:00 UTC
From: Monty=Wilson%Comm=Prod%PCPD=Hou@bangate.compaq.com
Message-ID: <803235833109n12@131.168.114.12>
Source record: 216484

My eight year old daughter is asking for radio lessons. I checked out the Gordon West books at Radio Shaft but he seems to use a format that's not well suited for those with a genuine interest in the technical end of things. This format of course is for each question in the pool, he gives the question, then the possible answers, then indicates the correct answer and a paragraph to explain why. I have known this format to be excellent for getting people on the air that don't have a genuine interest in the technical material, but I think my daughter will be as interested in the science as she is the license.

Is there a basic electricity and radio book out there that we could use, to be followed by the West class?

.....Monty WB5NVM.

I've got a '94 Acura Integra with a Kenwood TM-742A in it. I guess that you're going for serious HF power (I have no idea what an Outbacker is), but 40-50 watts, UHF-VHF, has caused no problems.

5125. Re: FT-990 Firmware Version?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-15 00:00:00 UTC
From: wa8msf@aol.com
Message-ID: <3rpcj0$o4u@newsbf02.news.aol.com>
Source record: 216487

I called Yaesu with the phone number supplied by an earlier response and found out that the '990 has to have firmware version 1.30 in order to work correctly.

You find out which version you have by holding down buttons 1 & 3 while turning on the power. After the "Las Vegas" light-test show is over, the firmware version is displayed in the right side of the window. I have 1.20 in mine.

Yaesu customer service offered to modify my '990 for free if I would remove a circuit board, wrap it up in anti-static stuff and send it to them. They said 2 weeks was typical turn around time.

Thanks to everybody for their help.

I have about the same opinion. I sent my FT727R back to the factory to
get a PROM upgrade. It came back dead. I called the service center,
and the manager asked me to send it back--attention to him. They
replaced the radio with a new radio immediately--no fuss, no argument--
in stark contrast to the horrible experience with the ICOM service
center, where all the opposite happened...

My experience with Yeasu repair has not been that plesant. It
took Yeasu 3 failed attempts to fix a problem that I never had to begin
with. The original problem was no audio just carrier on output of the
5100. When I got it back after repair - right out of the box the audio
in was completly distorted. ?? How could their QA miss this?? I sent it
right back. The second time I got it back after 7 weeks it did the same
thing. I sent it right back. ?? How could their QS miss that?? The third
time the radio was good for about an hour so I sent it right back. The time
has now been about 4 months. After this I did not here from them for three
weeks after they promised that this unit would go to the top of the queue
when it was received. When I called it had not been looked at. At this
point I asked for new radio and got it. So now its been about three or
four months since I got the new radio back and I now realize it overheats
all the time. Another time or two and its going to get packaged up and
sent to Yeasu management in Japan with a note of disatisfaction. I won't
be asking for repair or my money back.

Not a problem from a type acceptance point of view. If the radio has the appropriate type acceptnce for the service you are using, there is no type acceptance violation - emergency or not. You could use such a tranceiver for ham radio as well.

The issue here would just be authority to operate the equipment. Under normal conditions, the station licensee delegates authority as to who can operate under their license - in accordance with conditions of the license. During a "life or death" situation all bets are off and I would not worry about type acceptance - in reallity, with whom you communicate will be the issue.

Some thing to remember about Part 90 - Private Land Mobile Radio (which contains public safety, special emergency, industrial, land transportation, etc.): No operator license is required for part 90 operations. Type accepted radios do not provide the user with control over frequency selection except for pre programmed channels, transmitter power (with some exceptions) etc. There are no VFOs for unlicensed operators in part 90. Your amateur license confers NO authority to do anything under part 90.

As for the use of non type excepted radios by someone who is authorized to operate under a part 90 license: You must use a radio type accepted under normal circumstances. Under emergency conditions (and maybe Stan Harter - Cal OES - should listen here) the station licensee may operate in a manner normally prohibited by part 90. In other words, IF THE STATION LICENSEE AUTHORIZES IT, users under the license could be allowed to use non type accepted radios if circumstances made it necessary. There are specific requirements for such operations, such as notifying the FCC that you are doing it - and they (the FCC) can tell the licensee to stop such operations.

You might want to make sure that strap, as you're looking into the radio and at the VFO, is still soldered securely. With use as you turn the dial the strap comes loose after a while. I've had my TR-7 since 1983 and have had to resolder it twice in all that time. It's something to check anyway. Mine straigtened right up after being resoldered.

Well I have a FT-530 that has been modified to go outta band X-mit. I
work at the local university which uses Motorola HT's on 2 meter above
the ham band for athletic events. I use my 530 regularly at events to
communicate from the press box to the field with no problems. In fact,
they like the fact that I can be on the air without having to spare a
radio! I also monitor the info/security channels at work (primary job)
with the blessing of info/security. I also have the local PD programmed
into the radio with offset and PL and would use it in a life or death
situation. Better to lose my license than my life. But I would think
extinuating circumstances would apply in that situation. Just my $0.02.

Terry

Try U.S. Radio in Granbury, Texas, Ph. (1-800-433-7283). They sell new
Radio Shack products at a good discount, better than the RS stores. They
advertise no tax and free shipping to the lower 48. I don't know about
shipping charges to VE4 land. Good luck & 73s

Steve, WA6TAF.

5133. Old Collins 75A-3 For Sale

Collins 75A-3 receiver. AM/FM/CW...Here's the scoop on this thing...has some kind of BFO problem, whereby it's unlistenable in CW(SSB) mode until unit is warmed up for about 10 mins. BFO is unstable before then. Crystal Filter Phaser knob/shaft froze up for awhile; now free. No FM decoder installed. Also, has low audio output to speaker/headphone. If you've got the specs on this thing, most problems should be fixable, but you definitely get it as is. Looks good asthetically, with dark grey metal case. Unit was a bit jury-rigged before I got it used, so don't blame me! But when it sounds good, it sounds good, and have listened to HF DX from all over the world on a cheesy longwire from my apartment.

Covers 160-10 meters. Anyone up for the challenge? Make me an offer...Please e-mail me at xcsy38b@prodigy.com if you are interested. If nothing else, I would like to get the schematics on this thing. So, if you have an answer for that, I'd be interested in knowing a source...

Thanks....Rick Buser xcsy38b@prodigy.com

5134. HELP me find this PART - NEWBIE (X K band trans)

Body handling: HTML body converted to readable text

I am interested in building a device that will transmit microwaves
at 10.525 Ghz (X band) and/or 22 Ghz (K band). I need about 10 kilowatts
of power.

Does anyone know where to buy such a transmitter? I understand you
can buy a nifty little semi-conductor such as a Gunn diode, but these
damn things are difficult to tune correctly in an enclosure. They
also require special equipment that I do not have available.

I have heard that a person can purchase a device called a Gunnplexer,
which is used to activate intruder alarms and automatic doors - it
transmitts on 10.525 Ghz and is really the first step of what I need.

This device must be able to create "harmful" interference on X and
K bands...Of course, this will only be used in a lab setting (HA!)..

Any advise, comments?

Speaking of off-road racers, are they using their Yaesus on amateur frequencies?
Or or their Yaesus modified to another frequency range (and type accepted for
that application)?

It seems to me that the Nissan team is a commercial enterprise and use of ham
frequencies to support the race cars would be a no-no.

Can anyone enlighten me?

5138. Power Switch not in Power Line

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-16 00:00:00 UTC
From: rdixon@stargateacs.ohio-state.edu
Message-ID: <3rs5cb$gks@charm.magnus.acs.ohio-state.edu>
Source record: 216350

I just got a used Kenwood TM431 450 mHz FM transceiver. It does strange and intermittant things when first turned on, such as go into transmit all by itself, reset to default settings, change the offset, refuse to turn on, etc. In studying the schematic, I am disturbed to find that the power switch is NOT in the main power line. Many circuits are always hot on the power line, protected only by external 10 amp fuses in both the positive and negative 12V lines. The power switch just turns on the cpu and some transistor switches, which in turn activate the rest of the radio.

Is this good design practice? The radio could have components inside burning up that drew less than 10 amps, and you could not stop it by turning off the power switch.

Is this common design practice in other radios?

Is this related to why it does strange things when turned on? I normally leave the power switches for all my radios on, and turn them all on at the same time with the power supply switch. The others have always worked fine. Does this radio ever work if its power is turned on externally to its own switch?

If this switching is not related to the turnon problem, what can be the problem? Is the internal memory battery perhaps dying? Is the radio overly sensitive to the power turn-on waveform?

Thanks for your advice!

Hello,

I recently purchased a used Ameritron 811A linear. While I thought the gentleman said that the 10 meter mod had been done - I'm not sure now. The amp works great on all bands except 10 meters.

I sent off to Ameritron for the mod sheet, but it will be several days before it gets here. I'd like to open it up this weekend and see if the mod needs done or if there is another problem.

Can someone email me basically what the mod is, so I can tell if it needs to be done or not?

Thanks!

My experience with the Yaesu repair department was not a pleasent experience. In October 1993 I sent my FRG-100 in for a filter replacement (under warranty). Having been told by the sevice dept. that they would put in a new filter and a trimmer cap for the clock, and have it back to me in a week to ten days, I packed it up in the original box, etc and sent it off.

After waiting for 6 weeks I gave them a call. I talked to the technician, who said "it took some time to get the trimmer cap adjusted" but that he would send it out in 2 to 3 days.

Two weeks later I called to see where the hell my radio was. I was told that it had gone out the day before.

The next day a box arrived from Yaesu. The only problem was that it contained a commercial VHF transceiver that belonged to a company in Ohio. My receiver was shipped to that company.

Yaesu had each of us ship the radios to each other, so I finally got my radio in about another week. My radio was not in the original box and packing. it was bubble wrapped and placed in a much smaller box. Yaesu had lost my box and packing material.

Yaesu finally replaced the box, etc. and reinbursed me for shipping the transceiver to the right owner (this took 6 weeks).

I wrote a letter to the Yaesu service manager, his response took about 5 weeks, and his response was "shit happens." Not even a sorry about this.

So to sum it up, I think Yaesu service sucks.

Funny, I just heard on the news that Saturn was tops in "customer satisfaction". Towards the end of the piece was the revelation that the only parameters studied were purchase and initial ownership! In other words the sales people were nice and the car ran OK for the first hundred miles! You must have owned yours for a while! Are your problems radio-related?

It's interesting how folks with new anything will go to great lengths to prove that their purchase was justified!

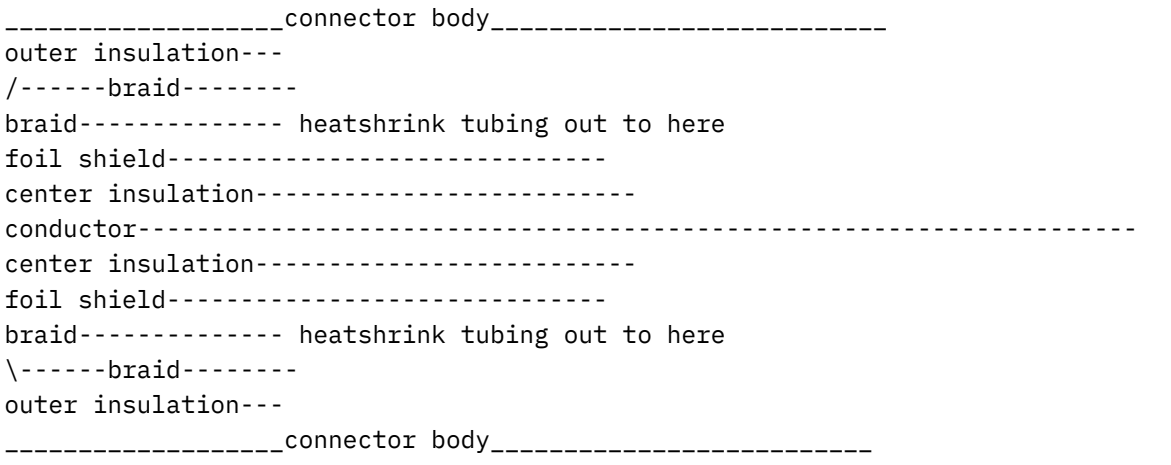
>Thanks,
>Steve N8KWV

Been doing a lot of this lately! My approach will surely not be everyone elses, but here goes:



The idea behind the heatshrink between the foil shield and the braid is to give a bit more protection to the center insulation during soldering. I leave the foil in place to give and additional heatshield, plus to maintain the impedance as far into the connector as I can. Note that the braid is slightly shorter than the foil and the foil slightly shorter than the center insulation. The heatshrink then extends slightly beyond the end of the center insulation. I shrink down the tubing, fold the braid over it and rapidly screw on the connector before the heatshrink stiffens up. This gives a nice seal at the center conductor. The solder the center conductor to the connector pin and the braid to the connector. Sorry I have no measurements for all this, I've been eyeballing these things for quite a while. If it's a problem, let me know and the next time I do one I'll measure things as I go.

What I've been thinking of trying sometime is using a double-wall heatshrink, the sort that has a glue in the center. This could do very nicely to give a

water tight (HOPEFULLY!) seal inside the PL-259. But don't know if the added thickness from the glue would make things difficult or not.

Good luck!

Yeah, I sent my FT-530 in for a defective battery latch and something
else I forget. The turnaround was relatively decent, but when I called
them to ask them to expedite shipping as I had an event I really needed
my radio for, they essentially told me to buzz off. I spoke to the
service manager who had the same attitude of not really caring. The
best service experience I had was with Icom. Total turnaround time for a
dead IC-R1, 5 days, including shipping and repair both ways! I think they
turned the radio in the shop same day.

Hello.

I just got an old (1962 model) Advanced SSB Tranceiver Digital .500D and need som tips.

The frequency display is not showing the right frequency, but displays rather random numbers, just the MHz display is showing the right frequency.

It is delivering rather low power output, maybe needs new PA tubes. Does someone know where I can get 6KD6 tubes? I have already got the driver tube.

> enclosure for your computer...

Now *this* is my kinda solution. I've been thinking of a grounded copper-mesh curtain I can draw to enclose the computer area (it's part of a large open room).

Does anybody have a feel for whether this will work? How fine a mesh do I really need? I presume a fairly large mesh will do, since 23cm is about as short a wavelength as I care about trapping.

AdTHANKSvance for any thoughts.

I have several Bearcat radios (300, 2020, and 800XLT) which do not work. I would like to try and repair them. I know that there are some common problems with Bearcats. If anybody could send me some information or files regarding Bearcats, it would be appreciated. Please send it to my Internet E-Mail at TVSJR@IX.NETCOM.COM

Thanks,

Terry

No. But ...

There are a variety of QRP kits available these days. I would highly
recommend Oak Hills Research. I am currently building a 30m QRP CW RIG
(the Explorer) and would rate their kits/instructions on par with the
Heathkit stuff (I built a number of Heathkits). They also have a QRP wattmeter, keyer etc.
They advertise in QST/73/CQ on a regular basis.
If I recall correctly this is a company which was founded by Doug DeMaw
(W1FB, I think) of ARRL Fame.

Also there is a new company called Wilderness Radio which was
created to take over selling the Sierra and Norcal 40A which were two designs
developed by the Norcal QRP club.

Wilderness Radio is an entirely separate entity from NorCal, run by Bob
Dyer, KD6VIO. (415-494-3806), or write to:

No earthly idea if it will work. But some text books on antennas indicate
a reflector element spacing of .06 wavelengths for the relector on a
corner beam antenna. Have a good time! Chris: cweddle@as.arizona.edu

Bad memory connection? Bad connector? Not having the switch in the power line is obviously a keep-alive that uses too much power for a Lithium battery et al. Whoever design reviewed the beast overlooked the inadequate protection...

This device is not a piece of cake : VARIAN used to manufacture such
transmitters (I used some of them, at those powers for heating plasma in
Electron Cyclotron Resonnace Ion Sources ...)
They are approx 2m high, 1m wide and 1m deep !.
Oscillator (generator) is classically a gun diode, followed generally by a
KLYSTRON. You need high voltage, very stron cooling (water generally :
efficiency is generally in the 50% range, so 10KW of heat, concentrated
in the klystron must be evacuated, ;;;)
Not to say, it's fed with high voltages, ...
The cost should be under the million dollars for the chaepest ...
VARIAN is really o good starting point, THOMSON too.

Just to fix ideas, at such frequencies, this power cooks (litterally) a
chicken in a few minutes and a human body in a few minutes more ... even
if it is not 2.45 GHz like in teh micro-wave ovens.

: This device must be able to create "harmful" interference on X and
: K bands...Of course, this will only be used in a lab setting (HA!)..

Hmmm, HARMFUL did you say ... That's the right word.

Take care

Darin,
Find an old magnotron (sp?). You cannot get 10 kW CW, but
you CAN get >100kW pulsed! Check out the surplus shops.

As far as I know, solid state devices aren't even in the
ballpark of the power levels you "need".

>extinuating circumstances would apply in that situation. Just my $0.02.

Your a bad boy, Charles. I would assume that the radios used at your sporting events are licenced under part 90. If that is the case - you cannot use your FT530. About the only time you can use a VHF amateur radio out of the ham band is when you are authorized as a MARS or CAP station. Operation of an FT530 on any frequency in part 90, 87 or 80 is a no - no. You're putting your ham license and the school's station license (since they are letting you do it) at risk.

Life or death situations are a differnt matter. But I would exercise all amateur options and try to find a telephone before popping up on a local P.D. channel.

While I don't have them programmed into my radio (due to limited memory in the FT5200), I would try my "company" frequencies first. I know what repeaters are monitored by pipeline control room operators and our security people 24 hours a day. I can at least explain who I am, a company employee, and no one will worry about the radio I am using - and have them make phone calls for me. If you make a distress call on a police frequency, you are more likely to call too much attention to yourself and have to answer too many questios afterward. Depending on coverage - I would call for help on your employers info/security channel before I surprised the police.

Source record: 216436

These items were obtained accidently at a government auction. They are
located in NW Ga area. I just want to get rid of them and recoup my
losses.
1 TU-77 Industrial Tape drive. This is about the size of a
refrigerator. Mfg. Digital corporation. Listen to these parts!!!!
2 radiators!!!
Lots and lots of motors!!!!
So many boards and components, it would take up too much space here to
describe!!
If you want to see it I live in Calhoun Ga and you can come and see it.
I'm not worried about anyone steeling it because it is too heavy!
If you buy this and strip it for parts the frame and shell are
recycleable.

6 Printers. 3 Wang, 1 Tandy and Two telex. 3 work, 3 don't (as far as
I know). They have LOTS of parts for salvage. They have coax
connectors instead of parallel interfaces. I guess they each weigh
about 40 lbs. One telex is on a stand and weighs probabully around a
hundred pounds. I'm asking $15.00 each for the working ones and $5.00
each for the non-working ones.

I'm sure that if you inspect them you'll find that these are good
deals. On the tape drive, make me an offer. Like I said I want to get
rid of this stuff.
E-mail me if you want to see this stuff.
If you like the tape drive and buy it, but you don't have a truck, we
could arrange a price and I'll bring it to you.

5170. Icom IC-W2A Tx audio improvement

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-16 00:00:00 UTC
From: al7dl@ki5pi.nmsu.EDU
Message-ID: <28826@ki5pi.nmsu.edu>
Source record: 216438

Improvement for transmit audio for the IC-W2A and IC-2SRA

The mic element for the W2A (2SRA) is located in the upper right hand side of the speaker grill (under the top depression). There is no hole in front of the mic element which means that you are having to talk through a solid piece of plastic to be heard. It's a 'bear' to get the front panel off the rig, so I decided to drill the case from the front with the front panel still on. Be VERY careful when you do this, for if you get too deep you'll drill out the mic element. Measure over about 5/16 inches from the edge of the right side of the radio and drill the hole in the depression. I used a dental burr and a Dremel hobby drill to make the hole. After drilling the hole, I found the transmit audio was much improved (to the level of the external speaker/mic.

I know this problem exists with the IC-W2A (IC-2SRA) as well as the IC-2iA and suspect it may be true of other 'migi' HT's from Icom and others. If you have a transmit audio problem check the location of the mic element first.

As with all modifications, I am not responsible for any mods done by the equipment owner.

5171. MODIFIYING HISTORICAL EQUIPMENT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-16 00:00:00 UTC
From: davidst1@aol.com
Message-ID: <3rrb6i$bvu@newsbf02.news.aol.com>
Source record: 216439

ENOUGH ALREADY

I just received Electric Radio number 74,
and am absolutely appalled and saddened.
I thought we'd finished with all this. ER #74 contains
a large article on "modifying" Command Set receivers
for double conversion. I propose that this is not only
destructive of irreplacable pieces of history, but that
it simply doesn't make good sense.

Suppose that you own a Ford model-T automobile
and you take it for a drive. On today's highways,
Porches and Hondas go zipping by you, honking.
You're hot, since the old highway vet has no air.
So you decide you'll "convert" your model-T to be
like a modern sports car!

What you have left after this butchery is neither
fish nor foul. It still won't go 0-60 in 5 seconds.
The chrome pipes look pretty silly next to those
spoked wheels and the jury-rigged fanbelt
for the air keeps flying off. Your model-T
has lost its meaning. It no longer has a story.
It is a nothing. Better to have enjoyed the old
Ford for what it was -- unhurried, uncluttered...
a masterpiece of simplicity that requires
a little skill and an appreciation of the romantic.

Command Set receivers are broad and tune fast.
No question about that. They were designed that way
on purpose. Formations of hundreds of B-17s would be
lucky to be within ten KCs of each other.
I have worked stations all over the west with them
in their original configuration and listening to
75 meters at night does take some patience and skill.
They are not Yea-Com-Woods. If I want sharp
tuning, sensitivity and punch I turn on my IC-735.
If I want history and romance then the filiments glow,
the dynamotors whir and I am a boy again, dreaming
boys dreams of flights of B-17s, when there were
still noble causes to live and die for.

Only a few of these historical rigs remain undamaged
by "modification." Let's keep those few so future
generations can know the romance of history.

"So these flew in the war so long ago?
That's really cool, Grampa....."

10kW at X-band are you sure about that you don't by any chance mean
10mW do you ? - I hope for your safety's sake that you do!

> Does anyone know where to buy such a transmitter? I understand you
> can buy a nifty little semi-conductor such as a Gunn diode, but these
> damn things are difficult to tune correctly in an enclosure. They
> also require special equipment that I do not have available.

The oscillation freq of a Gunn diode in a fairly high Q resonant
waveguide cavity is fairly well defined though as with most
free-running they drift a bit with time and temperature.

> I have heard that a person can purchase a device called a Gunnplexer,
> which is used to activate intruder alarms and automatic doors - it
> transmitts on 10.525 Ghz and is really the first step of what I need.

To get 10kW out of a Gunn diode it would be one hell of a diode!! The
efficiency of the Gunn diode is lousy, you need a supply of 7 volts at
about 150mA to get an RF power of a few tens of milliwatts. The most
powerful Gunn I ever saw was about 0.5W. If you *really* mean 10kW
then you need a big $$$'s klystron or some other breed of tube device.

> This device must be able to create "harmful" interference on X and
> K bands...Of course, this will only be used in a lab setting (HA!)..

Yeah, what *are* you going to do with it?!

Hope this helps a bit ...

All,

Does anyone know of some sources for 19" rack enclosures, not the really pricy one, but something more appropriate. I have the SESCOM catalog, but they have a 1 month back log, I need something a little quicker. I want to pay roughly the same price as the SESCOMS, like $45 for a 19x7x3.5.

Any info would be appreciated.

please post and email to ne1h@tornado.ne1h.radio.org

Thanks,
Alan Adamson

Sounds like an excellent reason to buy future radios from that high quality American manufacturer, Ten-Tec. Have never heard a bad thing about their service. For that matter, I have never had to use their service, the rigs have always worked for years and years without a problem.

>
> Much thanks...

You should have no problems as long as your power supply is well
ventilated. Astron supplies tend to run a little hot when there is either
no load or a near capacity load. I have a couple of RS-20's and an
RS-35 that I just mounted a small muffin fan to the heatsink.
The power supply rating of 9 amps is the limit that the components
can supply. If you try to load the supply to more than 9 amps you
will either notice a drop in supply voltage or run the risk of damage
to the components in the supply. Actually though the RS-12 will
supply about 12 amps intermittent, I think 50% duty cycle, and
I think the 9 amp rating is for 100% duty cycle.

Hi all,

I've been looking for a manual or schematic for a Motorola MAXAR, model D34TRA6000AK. This is a 450 MHz dash mount radio.

I desperately need a schematic to convert it to 9600 bps packet. I'm willing to pay for a manual or even just a photocopy of the schematic. I could use a copy of the board layout as well, but could survive with the schematic alone.

PLEASE PLEASE HELP ME FIND A SCHEMATIC!!!

73,

Jeremy WA7YGB

> would ever considere switching to another brand...

I own a TS-440, and I find that the synthesizer generates more phase noise
than an Icom of similar vintage. There is no transverter output on the
TS-440 either. Neither had been a problem for me until I became more
interested in satellite work. I can hardly use the TS-440 as the uplink
tx for RS-12 because of the phase noise.

Other than that, it's been reliable and quite a nice rig.

Now my Saturn SL-2, that's another story. I am tempted to trade it
for a dog, then shoot the dog! 8^)

> of power.

OK, I think we've pretty much determined that you are looking for a 10
milliwatt device rather than 10 kilowatts. I also assume you are looking
for "The Zapper" which is an amature radio transmitter used to practice
call signs and morse code at the 10 GHz range. These are available in
plans (book with 30 other kits as well is $15, or $10 with kit purchase),
kit form (about $40), or fully built (about $50) from a place called
Electronic Rainbow. (317-291-7262) The hard part you are trying to find is
probably a GaAs FET made by a company called Avantek, which was bought by
HP a while back. The Avantek part number is AFT 26884-STR, and Electronic
Rainbow has them for $13 each.

You need to be careful when constructing this practice code transmitter
because if it is not properly tuned, it will set of peoples radar
detectors for about half a mile or so. If you are getting one of the kits,
it is a surface mount project which is a little harder to deal with than
normal kits due to the small parts and relative dificulty in getting
componants - not that it can't be done.

I've heard of K band devices, but don't know how they differ in
construction from the X band ones.

Ham radio swap meets usually have a person or two there selling such devices.

TRW ARC sponsors a Swapmeet - Its the last Saturday of the month, every month, even if its Christmas (like last year). This is sometimes the 4th Saturday or sometimes the 5th Saturday - always the last Saturday. It located at TRW (surprised ?) - Corner of Marine and Aviation Blvd, in Manhattan Beach. From UCLA, take 405 south, to Rosecrans exit, head West till Aviation, then South to Marine, its on the right. Talk-in on TRW ARC repeater - 145.320, -600, PL 114.

Theres also one out by the LA county fairgrounds - DeVry Institute, the 3rd saturday (I think) - its a long way from UCLA.

Good luck and 73's de Dave, kd6pro.

From: Monty=Wilson%Comm=Prod%PCPD=Hou@bangate.compaq.com
Subject: Recommend a text on basic electricity and radio?

My eight year old daughter is asking for radio lessons. I checked out the Gordon West books at Radio Shaft but he seems to use a format that's not well suited for those with a genuine interest in the technical end of things. This format of course is for each question in the pool, he gives the question, then the possible answers, then indicates the correct answer and a paragraph to explain why. I have known this format to be excellent for getting people on the air that don't have a genuine interest in the technical material, but I think my daughter will be as interested in the science as she is the license.

Is there a basic electricity and radio book out there that we could use, to be followed by the West class?

> enclosure for your computer...

Now *this* is my kinda solution. I've been thinking of a grounded copper-mesh curtain I can draw to enclose the computer area (it's part of a large open room).

Does anybody have a feel for whether this will work? How fine a mesh do I really need? I presume a fairly large mesh will do, since 23cm is about as short a wavelength as I care about trapping.

AdTHANKSvance for any thoughts.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483. Uniden currently charges |
a flat rate of $54 for scanner repairs. They will repair |
and return "out of warranty" items without an estimate |
unless the repair charges exceed the flat rate charges. |
The phone number for repair is (800)297-1023.

G & G Communications (telephone (716)768-8151) is a family | owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the

squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally

mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the

"down" position. Scraping the circuit board between the
two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics
in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

The TH-78A is unable to receive wide band FM. At least, there's no known way
that my 3+ year old rig could do it. Perhaps some of the newer 78a's or the
79a is the way to go.

I have used the Davis Weather Monitor II for several years. Basically, I am quite pleased with it.

I did have to place ferrite chokes on every lead into and out of the unit to prevent false readings from HF and VHF RF. Once installed, they solved the problems.

Hi my name is Tom T. Shaffer (KB2URI) a no-code Tech licenesse (sp?) I am a Refugee From the" CB. I became intrested in ham radio when i got sick of the limitations of the CB, Unfortunaly with change came problems. The 1st of all my problems was that i am not mechanicly inclined, So building my own equip is pretty much out of the ballpark. So Buying equip. seemed to be the ans., well i got catologs and the prices along with the wide selection really confused my simple mind. Then someone said to me why not look for an older radio, or see if you can work out a deal with someone.. Thats what I'm askin is that if you have an old radio for sale, and want to help a newbie out please mail me back, I dont have a heck of a lot of money so if you want to work out a payment plan or something let me know. Im looking for a 2m radio or any combo of such. Well ive rambled on too much. Oh before i stop any ANY advice about ham radio and getting started is VERY VERY warmly welcomed!

Thanks for reading & Thanks In advance.

>in stark contrast to the horrible experience with the ICOM service
>center, where all the opposite happened...

I am having trouble parsing the above statement regarding Icom. Did you send your rig to Icom, have it come back live, then send it to the manager who made a fuss and argued with you and didn't replace it? :-)

Seriously, what was your bad Icom experience?

: : I am looking for a program that will work with the baypac-1
: : bp-1. the current program that I am using is baycom.....
: :
: : but it has many problem.....the BIGGEST is the fact that the
: : text is VERY TINY!!

: HUH? I run it on my PC, the text is normal sized. I run it on my HP100LX,
: the text is tiny, but so is all the other stuff on that. What are you
: running it on? Perhaps you need to change the default font on your PC?

: Bill B.
: KC7JSD

Howdy - The reason your text is so small is because the "vadapter"
setting in your SCC.INI file is set to "0" (the default). On computers
with EGA/VGA screens, this gives you 43 lines (tiny characters!). All
you need to do is set the "vadapter" line in the scc.ini file to "1"
(CGA-Color) and you will have a normal 24 line screen (much bigger). As
for other programs for the BP-1, there are several. But NONE work as
well as BayCom. You might consider getting BayCom Version 1.6 for a few
new features.

G'day All,
I have a Motorolla radio. It has MBR on the front, just a volume and sequelch knobs and is naturally enough crystal locked.

On the back it has a model number of ATD34GMA3000AK
Type No. GMAG-25
P&T No. 234217

I'd love to know if this radio can be used on amateur radio bands. I believe it is a UHF band (420-450 MHZ in Australia). Also any other info would be most welcome.

5220. Need 50 mile range on HF

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-18 00:00:00 UTC
From: dan@guardian.tessi.com
Message-ID: <3s2i55$79l@guardian.tessi.com>
Source record: 216316

My wife and I are hams and have need to keep in communications while I am on the coast. The distance from Portland is roughly 50 miles and we have found that the 2-meter repeaters don't afford the flexibility or privacy we need to discuss matters that the rest of world has little interest in. I have a HF SSB rig and was curious if a 80-10 meter link with a mobile rig like the TS-50 or Icom 706 would work out for us. Has anyone tried 50 mile QSO's during the day on any of these HF bands with success ? I suspect 40 meters might work out as a good choice, but how about daytime 80 meters or 10 ? I just don't have a feel for reliable communications for such a short distance.

suggestions ?

I have a nice 3 1/2" dia Bird (Simpson) Meter assy, Termaline Model 6732. On front, there is a Range sw which reads 10, 50, 250, and OFF for FS readings. Freq: 25- 1000 MHz. Also has SPARE DIODE Holder (w/ ceramic diode). A 4' coax cable w/ a screw in connector is attached to leather handled metal unit. Where can I get matching assy to use this unit? I called Bird and they were not helpful. Offers accepted for this unit, too.

FOR SALE:

YAESU FT-411E 2 meter handeld transceiver. Great condition, barely used
by an inactive ham, about 4 years old. Comes with all the bells and
whistles, 2 nicad battery packs, charger, high gain rubber ducky, and
original box. Great radio, I just don't have any use for it.

This is the radio that was recently replaced by the FT-11R, and has
basically all the same features.

Asking $225, or best reasonable offer. Sorry, pick up in Boston only
Will also include a 2 meter Larson through-glass antenna for another
$20 bucks if you want it.

Please email: dcassell@lynx.dac.neu.edu for more info.

Check the ARRL handbook in the Interferance chapter, section titled
'Filters for VHF Transmitters'. I built the 2m version, the 6m version doesn't
look any more difficult.

It's a little hard to think of what would be good for an eight-year old.
One book you might take a look at is Doug DeMaw's "First Steps in Radio".
I took a quick look through the book. It looks a bit like the
Handbook in it's discussion of theory, but only does things that the
elementary level. It covers a bit of everything: resistors, capacitors,
antennas, propagation, putting together a station.

You should be able to get it from ARRL or local ham radio store.

For short distances, Near Vertical Incidence type of antennas on
HF are preferred. A low dipole will probably work fine. I suggest
40M as the most likely daytime band. (Vertical antennas have a low angle
of radiation, and are better for DX than short range).
Mobile antennas are usually vertical, and probably not the best choice.
It might work, however.

I posted this a while back, but here it is again...

YAESU FT-51R

Expanded Transmit 140-174 MHz, 420-470 MHz

MARS & CAP MODIFICATION

This information is authorized for distribution only to
individuals who are members of the U.S. Military Affiliate Radio System,
Civil Air Patrol, or other government agency services specifically
permitted by the FCC to use non-Type-Accepted equipment such as that
utilized in the Amateur Radio Service. Release of this information to
individuals not bearing a license in the MARS, CAP, or other such
government service is not authorized by Yaesu U.S.A.

* Remove Antenna and Battery

* Remove (6) black screws in rear plastic cover plate
(where the battery would normally fit)

* Remove the (1) small black screw in the battery slide switch
(see figure 1 below for screw locations)

* Loosen (but don't remove) the (4) black screws on the upper back of rear case and slightly separate the rear radio case.

* Remove the "L" type plastic cover

CAUTION: Watch out for the delicate ribbon cable

* Locate and unsolder jumper pad #6 (see Figure 2 below for jumper locations) (Pads 1,7 should now be jumpered) (Stock, Pads 1,6,7 only)

* Reinstall the "L" type plastic cover

* Tighten the (4) case screws on rear case

* Re-install the (6) black screws in rear plastic cover plate.

* Re-install the (1) small black screw with the battery slide switch

* Now attach the antenna and battery

* Turn off Radio... Press and hold both UP & Down Arrows Keys (right side) while turning on the Radio

* Modification now complete!

(Figure 1 not rendered; my ASCII art skills aren't that good)

Figure 2: Jumper locations. For European tone burst, add solder to jumper 4.

Kevin K. of Yaesu provided some great info about their new FT-51R HT, at the recent meeting. He also described some undocumented features. For those who want a hardcopy of this, here it is.

YAESU FT-51R Soft-Modifications - undocumented: February 1995

The new FT-51R utilizes software to control the various deeper level functions instead of some traditional pots.

To access this undocumented menu:

1. Turn on radio, and select band you want to modify.
2. Turn off the radio.
3. Simultaneously press the 2 VOLUME keys and the CALL buttons while powering on.
4. You're now in the soft-mods menu.
5. You'll now see the following menu choices while turning the DIAL knob:

BAND 1 (top of menu)
IF NO 0
S-FULL84
S-1 19
SQL TH64
SQL TI4E
MOD L 25
MOD H 27

The only soft-mod I'm familiar with so far, is to change the deviation setting for the mike.

Turn the dial until you see MOD L 25:
1. Press the FUNCTION key down for 1/2 sec. until F flashes.
2. Press the /\MHz or \/MHz to change the numerical value.
3. Press the FUNCTION key again to save this change.
4. Do the same for MOD H 27.
5. Power off.

I'm not sure exactly what the numerical values mean, so experimenting is in order.

I'm also unclear as to what the other menu items are. I believe they have to do with squelch settings, i.e., threshold.

I've also been told that the software can be controlled by an external computer, by accessing the handshake via simultaneously pressing 2 and 9, and powering on (remember MH-29, model # of the LCD mike). I don't know what connector or software is needed.

Please send any info you have on these soft-mods.

Michael's statement that it's not a good idea to connect a
station ground to a water pipe has me wondering. Is this generally
accepted as true?

In my years installing telephones, we were taught to ground the protector
(lightning/power arrestor) to a cold water pipe. The use of ground rods
was considered as a poor second choice arrangement.

5237. Re: Yeasu Repair

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-19 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <DAFq1q.36o@icon.rose.hp.com>
Source record: 216259

Well, this thread has me worried...

I have a Yaesu FT-767 that I really like, but it seems to have developed a problem where:

1. in SSB operation, the DRIVE control has no effect; it's essentially cranked all the way up no matter where it it set. Ok, I can live with that.

2. In USB (not LSB) operation, I sometimes have to talk REAL LOUD to get any sort of power out. The power-out meter makes a quick blip up, then settles down to only a couple of watts out unless I scream. It doesn't happen all the time, but I haven't narrowed it down more than that.

SO... What To Do?

Do I: Send it back to the factory for service?
Try a local place and hope to find someone who's seen the radio before?
Find a mail-order company with a service department (AES?)

Recommendations? These radios are so unservicable (nest of wires attaching sub-assemblies which interconnect like a Chineese puzzle) that I assume the factory is the best place. But with comments like this thread, I worry the rig may come back worse than when it went in.

Thanks,

Greg KO6TH

: : >brands of radio. Both seem to be very exeptional equipment
: : >from what I can tell, but does ne have the advantage in
: : >overall durability, reception, quality, etc?

When I bought my Kenwood TH28a, I was looking for the most bells and
whistles for the least price. Kenwood definatly fits into that
category. Most other radios in its price line require you to throw in a
bunch more money to add other options. Kenwood has nearly all of them.
As for durability, I sent my first radio back when the encoder (tuner)
knob developed the jitters. They replaced the knob, and replaced the
jacks on the top. The knob has been no trouble since, but I have
problems with the earphone and power jacks: I'm never too sure if they
are working... The earphone jack, for instance, also has a conductor for
the remote control function of their hand mike, so often times, I would
plug in an earphone only to have it switch frequencies on me. Then again,
I have often dropped the thing: one time i n particular, I fell down a
ten foot cliff of soft dirt and rock... I watched the radio disappear
under a shower of dirt and rocks, yet when I pulled (dug?) it out, it had
only changed frequencies and gotten dusty and scratched.
Reception is okay, but Kenwoods have incredibly wide front-ends... In
large cities, noise from pagers is intense... in most of the models I've
seen. In my HT in particular, adding a 5/8 wave slimduck (Smily Antenna -
I suggest it.) only makes the intermod worse. (Oh, but Tx and Rx are
better with the antenna...)

I think the Icom is probably a better, more professional radio... But I
love my Kenwood: it does all that I ask. And that new 79a is a pretty
slick little rig!

Welcome to Ham Radio!

5241. Data Controller Survey

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-19 00:00:00 UTC
From: n0dh@comtch.iea.com
Message-ID: <3s4jlj$ohb@krel.iea.com>
Source record: 216263

I have been using a PK232 for the last 5 years, but alas due to the unfortunate choice of cheap RS batteries for the memory backup along with the unfortunate design choice by AEA to suspend the battery holder from the top of the case over the circuit borad the circuit card is now ruined and inoperable due to the combined chemical etchant effect of leaking batteries and gravity.

So faced with buying a new (or used) replacement I am interested in what the consensus is on multi mode controllers these days.

So what do you like and why? Which ones would you avoid like a goos case of the plague?? I use my Pk232 for VHF packet and HF RTTY mostly. I am interested in some of the the newer modes on HF as well which my older PK232 does not cover.

Dave
n0dh@comtch.iea.com

PS: All you Pk232 owners out there. If its been over a year since you changed your batteries now would be a REAL good time to do that!!! And while your at it pay a little more for some really good leak proof batteries!

Source record: 216268

I recently heard on the ham radio & more shortwave broadcast about a PC card that you can install. Its an HF transiever with software to operate it.

It looks VERY nice, and is pretty reasonable for $.
($400 range)

Supposedly you need some sort of amplifier for it though, so I dont know what the added cost would be.

I would like to know if anyone has one of these, and what they think, and what peoples opinions are.

I am trying to get into HF, and would like to get an HF radio that has good coverage and good features, but a minimum of $600-1000 for a radio is kind of pricey.
I have a 386 at home already, and this board would hopefully give me very nice performance for around 4-500 bucks maybe.
Plus it expands via software for free - its like a radio that expands as time goes on for free... just download from their bbs.

If you want to know about this board, you can call them at 619-599-0476.
They also have a bbs at 619-599-0185.

Check it out, and let me know what you think.
If you have any other suggestions for an HF radio, please let me know - im looking to get into one, but am wary of used stuff because im worried about the quality/condition of what im getting.

Any help is VERY VERY appriciated.
THANK YOU VERY MUCH IN ADVANCE!

Well I would suggest that if he has a budget for the 10KW Klystron, then
he can afford the active tracking dish that seeks and finds the
radar source pretty quick. Also I would suspect that with a modest
gain antenna, say a 35 cm or so, you would probably only need to
pulse it for a few microseconds to fry the front end of the smokies
radargun. And 10 kW for a few microseconds would hardly bother
the driver much. Now you would probably need an 18 wheeler for the power
supply and generator, and the radome and such for the tracking
antenna - but it's doable;-)

A radar seeking missle would probably be cheaper tho.

These batteries are probably beyond use. The useful life of a gell cell is typically 5 to 7 years under ideal conditions. If well maintained, the cells will have about half of their original capacity as well as a much higher internal resistance after this time. If the cells have been stored in a discharged or undercharged state for much time at all, they have probably undergone an irreversible "sulfation" reaction that ruins them. Sometimes it may be possible to apply much higher than the normal charging voltage (i.e. 15.5 V or more rather than 13.8 V for a 12 V battery) to attempt to "revive" them. During this process the battery may vent or even burst, so be careful. If the battery gets hot, quit charging it. My experience has been that this does not work very well. If the battery does "revive" it will have very little capacity. Also if the sides of the battery appear to be bulging, this indicates the lead plates are swolen and sulfated inside and the battery is probably bad.

Dead sealed lead-acid batteries must be recycled rather than landfilled, as they contain toxic soluble lead. Some places that recycle auto batteries may take them.

Yuasa company, one of the big manufacturers, used to print a "Application Guide" that was about 20 pages of very useful information on the care of this type of batteries. I don't have my copy any more, but you could probably get one from a Yuasa distributor.

Charging: Several methods are possible. All voltages are for a "12V" battery of 6 cells. Other voltages can be scaled accordingly.
- "Float Charge": Connect the battery to a constant voltage source of approximately 13.6 to 13.8 V (depends on the temperature) for a 12 V battery. The battery will take less and less current from the source as it becomes charged. In many cases, no current limit is required. Charging may take 10 or more hours, but may be continued indefinitely without damage. This method is most useful for "backup" applications, as 13.8 V loads can also draw their operating power from the battery charger. The battery will not reach a completely full charge, only about 90%.

- "Two Step Charge": This requires a special charger that supplies about 14.6 V while the battery draws a heavy current, then drops to a float charge at 13.6 - 13.8 V. The higher voltage will charge much faster than a float charge. Also more complete charging results. The charge rate should be restricted to 1/4 the capacity however, so a complete charge still takes 5 hours or so. Also the battery generally has to be disconnected from the load so the load will not "fool" the charger into supplying the high rate. This method is well-suited for cyclic applications where the battery is charged, then taken out and used.
- "Taper Charge": Using a high-impedance source, which can supply only a few percent of the battery's capacity at 14.5 V. This is the really inexpensive method, using a "power cube" or "wall wart" as the power supply. Generally not too desirable, as the charge time is long, and there is some possiblity of overcharging. Yuasa tests their batteries at 1000 hours application of C/10 constant current and claims it does not damage them noticeably though.
- Solar charging: Yuasa recommended that for the typical solar installation of a large battery and modest photovoltaic plant (C/10 or less), that the solar panels shoud be simply connected right to the battery (thru blocking diode of course) with no need for charge control of any sort, as the occasional overcharge will be absorbed by the battery without damage.

Other hints about gell cell batteries (I think "Gell Cell" is a trademark of Gates Co. (not Bill Gates), so other manufacturers call them "Sealed Lead Acid" or some related term):

-Never fully discharge them on purpose. Each deep discharge cycle takes a lot away from the life of the battery, and may cause sulfation.
-Always recharge completely as soon as possible after any use. Longest life results by keeping the discharges as small as possible.
-Charge with a constant voltage, not a constant current. Limit the charge current to capacity/4 (i.e. 2.5 A for a 10 A-H battery)
-For many reasons, try to specify batteries larger than you think are necessary: The life will be much longer, since fewer deep cycles are taken. Also the *actual* capacity of a battery is less than the stated one if the discharge time is less than 20 hours. Batteries will deliver more useful power if discharged slowly. Finally, after several years, the capacity will decrease due to age. Starting with a higher capacity extends the useful life of the battery in the system.

I think they sell a kit at Rat Shack that puts out about 20 pounds.
If that is too much for your application just put one of those
resistor thingies in series with the power supply. About a 1K-Ohm
one would probably work, if you are using 12 volts or use a lower
voltage battery.

Also, you can connect the power in the reverse direction on many
radar detectors and they will actually radiate instead of receive.
If you use 6 to 12 volts of AC, then, you can make a pretty good
radar, except you'll have to hook up to an oscilloscope modified
for circular scan.

Well, Dan, with great respect, but I have to wonder if amateur radio is the medium you should be using to discuss your private affairs with your wife or anyone else. I thought amateur radio existed, in part, to further the science of radio. Perhaps you should consider a commercial radio service of some sort.

From: forsberg@cts.com
Message-ID: <DAEEv7.DKA@crash.cts.com>
Source record: 216327

Just thought I better put my two cents worth in about Yaesu repair service. I have had no experience with Yaesu repair service!!! This is good. I have had experience with ordering parts. The battery in my rig (FT-757GXII) ran out after 3 years. They sent me another one free. Then while I was putting it in I accidently shorted out a coil. I called Yaesu and again they sent me the part free of charge. I sent them a check for $5 dollars anyway and they sent the check back and refused to accept it. I have also had a couple of times that I wrote them with technical questions and have always received prompt replies. Their customer service in my view is first rate. The best I have seen!

Would I buy a Yaesu rig again ? YES!!!

I have a slightly questionable question to ask.

I used to have a Ranger RCI-2950 that had been modified to operate on both 10 meters and the CB band. This was extremely convenient because I needed the CB band for a 4x4 group and I liked playing on 10 meters.

My truck was recently stolen and I need to replace the radio, but I was thinking of getting a more sophisticated radio. I am thinking about something like the Yeasu FT-900, Icom IC-706, or the Alinco DX-70T. I'm not really considering the Kenwood TS-50 only because it does not offer a detachable front panel.

Does anyone know if any of these radios can be used on the CB band? Or, if one can be modified to work. I hate the thought of having a regular CB in my truck.

Outside of the CB thing, what do you think of these different radios? Also, what antennas seem to work best for a multi-band mobile installation? I am getting information on the RoadRunner, BroadBander BB3, and High Sierra antennas.

Thanks for any help you can provide ...

I am looking for mods for the Alinco DX-70 "radically small" HF rig.
This rig covers 6 meters, so I presume the following mods exist:

a. Wide Band TX/RX for HF (150 thru 30 Mhz TX)
b. Extended VHF TX/RX coverage from 30 thru 54 Mhz, or at least wider
coverage than the "stock" 50-54 MHZ RX

Thanks...

Dear Sir,
Use of Amateur Radio Equipment on the CITIZENS BAND is ILLEGAL in the United States and could result in suspention of your amateur (ham)license, a fine, a jail sentence, or possibly all of the above. Please DO NOT use amateur radio equipment for CB. In some countries, other than the USA, use of AMATEUR equipment in HF/Commercial applications are LEGAL. This is why the manufacturers offer means of modifying the equipment. However, let me repeat that in the USA it is absolutely ILLEGAL to transmit on CB without an FCC type accepted transmitter. Of course, receiving (listening) is ok.

Hello All....

I'm currently running a Wildcat! BBS for the Solano County Office Of Emergency Services. We are
looking for software which can allow users to call on a land line and then go onto packet from the BBS.
The software will need to run as a door program through Wildcat! BBS software so we can limit
access. If anyone knows how I can do this or where I can obtain the software from please Email.

Thanks...

Lane Kendall <dlk@doar.mhs.compuserve.com> posted here, in
rec.radio.amateur.equipment, an ad for his old
computer system that he's trying to sell.

It had nothing to do with amateur radio, so it did not belong
here.

Furthermore, from a recent thread here I'd like to point out
that this is newsgroup is not intended for buying and
selling equipment, even if it is amateur radio equipment.

While the name and real intention isn't all that clear, this
newsgroup is meant more for discussing amateur radio equipment.

Since the recent thread suggested that we reduce the clutter
by making the purpose of this echo better known, I thought
I'd take my turn at this one, since it is completely out of
place on this newsgroup.

I have the system made by Peet Bros. It works fine and is easy to use.
However, it did get its brains scrambled by a recent near lightening stroke.
It eventually recovered with no apparent permanent damage. I recommend adding
lightening protection to its remote sensors.

Monty,
Have you tried the ARRL Handbook? It gets pretty technical
in spots. The ARRL puts out several other books that specialize
in different areas. Most of them get into the science of how the
things work. It (the handbook) goes into, or at least used to,
how tubes work, (remember those?) transistors, and a very good
section on propagation. I don't have the new one (1995) but the
ones that I do have don't discuss the test questions at all, just
theory, a little on rules/regs, a little on the history amateur radio.

Kevin Muenzler, WB5RUE
I am not a salesman for ARRL, nor do I play one on TV

Henry Radio in West LA, Santa Monica actually, is the place to go. They have been around for years (they were old and dusty when I was a 14 year old newbie amateur radio operator in 1964). They have many many general coverage short wave receivers with multi-mode capability AM-FM-SSB etc.

They will be in the phone book in the yellow pages when you get to LA, or alternatively from operator assistance. Physically, they are west of the 405 freeway, north of the 10 freeway. Twenty minutes from the airport (LAX) on a good day.

Enjoy browsing, they have good staff, good pricing...

>Charles
>KD6DJG
>

I have the flip side. In college, I bought an ICOM IC25H. It came out of the box without transmit audio and with the wrong power cord. A trip to the ICOM service center, and instead, it had low transmit audio. Three trips later, the problem was not corrected. ICOM refused to replace the radio. By this time, shipping costs had bolstered the brand new radio's cost by about $100 (insurance on a new radio plus express shipping). So I just decided to use the radio as was.

A week before the warranty ran out, a voltage regulator in the radio went out, and I spent more money sending the radio back to ICOM. About a year or two later, the power amplifier module went QRP on me. Rather than play the same expensive game with ICOM, I sold the radio and bought a Yaesu. Net damage for that damn 2M ICOM: about $500

The one time I had to deal with the Yaesu service center was to get the firmware in my FT-727R upgraded. I agree that their outgoing QA needs help--the radio showed up dead. But a call to the service center's manager got the response that I should send the radio back--attention to him. And what I got back was a brand-spanking new radio.

Steve,

I had a Kenwood TM241A for a weekend, and you should be aware of the following:

1) The aircraft receive is essentially useless... even if you live by an airport.

2) The receiver is too open to intermod from the paging transmitters in the low 150 MHz range. (I live in an area that has many transmitters --- Northern Virginia.)

3) I found the controls to be not that sturdy (my opinion).

On a bright note, with the rebates/discounts now available, you can pick this rig up for approximately $290...

In my case, the solution was to purchase a Yaesu 2500M... which doesn't experience the problems stated above! With the current rebates, you can pick this rig up for approximately $335... but I believe that this is a quality rig... both in construction AND performance! (And the majority of my station equipment is Kenwood...)

Good luck...

>BTW, I am using the FIT-232 and the same cable when switching between the
>FT-1000 and the FT-990.

I am using the FT-990 and FIT-232 interface with LOGEQF, and it works correctly, although I would say that polling (i.e., download from the rig) seems somewhat sluggish.Changing frequencies/modes through the logging program is instantaneous.

Are you changing rig files in your log program setup? I know that there are some firmware differences between the 990 and the 1000. The documentation with LOGEQF indicates that the 990 does not support automatic update, while the 1000 does (but it's not clear to me whether or not that limitation is imposed by LOGEQF or the 990's firmware).

I assume that all of this is through the same serial port on your computer. If not, bad serial port?

I did have some problems initially due the setting the stop bits incorrectly for the 990, but once I corrected that, everything was fine.

>
> Can anyone enlighten me?
>
> George, N7TNJ
>
>
Hi George N7TNJ... Yes they were used on Ham frequencys'; several of
the drivers are licensed Hams. They were provided for emergency use; ie.
break down or injury to the racers. The radios were installed but usually
not on... The reason being, they couldn't hear over the engine noise.
<audible & rf generated> It seemed like good PR an publicity. It was not
a "True" test of strength per say... The racing team is a commercial enter-
prise but the chase an rescue teams work the same as any group of amateurs
participating in any event. Besides - when racing the driver doesn't have
time to rag-chew. He is usually hanging on for dear life an going like _ell.
I know, I've had my turn at the wheel in Baja several times. As in all
ham advertisments, its usually more hype than fact or at least the usuall
degree of exaggeration is employed.

Hi there,

I just got a c550 as a present. It's a great twinband handy but mine
is limited to the european amateur frequencies, ie: 144-146, 430-440.

I have found information on how to extend the frequency ranges for
c528 and c558 on oak.oakland.edu but none for the c550.

** Does anybody have any information on how to extend frequency ranges
of the c550?

** Does anybody know what the real differences are between the c550
and the c558?

Your help is greatly appreciated.

CE>From: CENTURYMAN <CENTURY@CRIS.COM>
CE>What is the difference between the DR600 and the DR600TB?
CE>Are there different radios? Can I make the 800MHz mod to bot of them?

The difference is the DR-600T has the board for 800mhz in it. The
DR-600TB does not. You can buy the board for the DR 600TB from HRO or
any other Alnico dealer. The part number is EAK-599. HRO has it listed
for $ 29.95. You can get prices for the radio on HRO's homepage. URL -

Source record: 216211

Hi:

I recently noticed a loss in sensitivity in the 2m receiver in my IC901. I remember reading a thread recently that this might be a common problem (bad diode switch..??). I'm thinking the problem might lie either in the antenna switch or the first preamp sections. I get full 50 Watt output from the xmit and the 440 section operates normally. Any help would be greatly appreciated.

>
> TNX ES 73,
>
> Rick WB9GYT
>

Hi Rick.
Although your message specifies that you are looking for a low-pass
filter presumably to put on the back of your 6M rig, I just thought I'd
pass this along;

I clipped a review from 73 magazine a few years ago (Feb.89) regarding
the STAR Circuits 6 meter filter. This is a notch filter that connects
to your TV or VCR with adjustments for center frequency and bandwidth.
Up to about 40 db of attenuation at the center frequency which you would
probably want to set for around 50.125 or thereabouts if your primary
interest in 6M is SSB/CW. Insertion loss is 2.2 db.
Let me know if you want more info. (no sense writing a book here if you
are really only interested in a low-pass filter :)

Regards...Hugh VA3TO

 NFX v1.3 [000] 6 meters...Yours to discover !

Hello all the readers,
probably my question is stupid but here in ITALY we have an HT800
Motorola portable that I don't know if is the same as an HT600 or is an
older model. In that worst case is impossible to tune that radio into the
HAM bands if you do not have the 136-156 version, is a problem of the PLL.

that's all bye Fulvio

Industrial Communications Engineering (ICE) makes them. Don't have their
address with me, but they advertise in QST and CQ. I think they run about
$60.00. Radioware sells the ICE filters and you'll probably get faster
service than from the factory. Radioware advertises in QST and CQ also.

5304. Stock fault on FT-n90R mk II ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-20 00:00:00 UTC
From: adsb@bnr.co.uk
Message-ID: <3s6besINNerg@bhars12c.bnr.co.uk>
Source record: 216280
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

I noticed that my second-hand FT-690R mk II was off-channel,
and a little investigation revealed that the 13.53 MHz xtal
reference oscillator is about 3.5 kHz low - too much for
the trimmer cap to bring back.

I've heard rumours that this fault has been seen before on the
FT-290/690/790 series. Can anyone confirm whether this is true,
and if so point me at the culprit? (just to save the hassle of
unsoldering glued-down chip caps if they're not to blame!).

From: wa8msf@aol.com
Message-ID: <3s765b$3ff@newsbf02.news.aol.com>
Source record: 216287

Hi John!

I have solved the FT-990 firmware problem. I had version 1.20 which does not work with my programs, and I'll bet would be a disaster with yours. It takes a full 4 or 5 seconds every time it's polled for info during which time the audio output is disabled. Version 1.30 fixes this and more. To test for version number, hold down buttons 1 & 3 while powering up. The version number shows up on the right side after Y - A - E - S - U is finished at the end of the display test.

I solved my problem by trading in for a newer unit. I was about to go for a used for only one week "demonstrator" that was 2 years newer than my old one. Until we checked the version number!!! It was version 1.06!!! It seems the fellow that returned the unit wasn't too clear why it didn't work out for him. I explained to the salesman that the previous "owner" had probably already owned an older '990 and swapped the controller board with his old one and brought it back. The salesman was visibly taken with the possibilities.

Yaesu will upgrade the firmware at no charge if you remove the circuit-board and send it to them.

Thanks to all who responded to my original and subsequent posts.

Hi Bob. I have a friend who just told me about this problem with his HTX-202. With things like this turning up all over the country -- problems, problems, problems, I can't help but believe that all the posts regarding the poor quality of these radios are true. Sure, I'll admit that having a HT with good rejection of out of band signals is nice, but it is also nice to have a HT that works. I don't think I've heard of so many problems with any other single model of HT. Every company puts out a dud once in a while but the record of the HTX-202 just doesn't seem to represent the record of a good product.

I'm not trying to bash anyone for choosing this product, as I might have considered this radio were I to need a new 2m HT. The price is attractive.

I'll let my friend know that he is not alone with the transmit failure problem. I don't know if he got his new or used, so I don't know if it is covered by a waranty or not.

73,
Ken

5317. FS: Icom VHF Handheld Bid (Large Lot)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-20 00:00:00 UTC
From: Steve Kennedy <prografx@teleport.com>
Message-ID: <3s7k43$l3p@maureen.teleport.com>
Source record: 216293

From: prografx@teleport.com (Steve Kennedy)
Subject: FS: Large Lot of Icom Handheld Radios
Date: Tue, 20 Jun 1995 12:01:35
Keywords: Icom VHF Handheld Digital Encryption

For Sale to the Highest Bidder:

1 Lot (where-is, as-is) of the following comunications equipment:

---

475 (qty) Icom IC-H10SR VHF handheld radios:

These radios came from the factory supplied with GEC-Marconi DM8000 Digital Encryption built-in (hence the SR suffix...Secure Radio). Units can be used as normal without regard to the encryption, and will function the same as a standard IC-H10.

435 radios contain encryptors with the DES algorithm, and are not exportable.
40 radios contain encryptors that are non-DES, and ARE exportable

Radios are spec'ed 150-174 Mhz, 4 watts out (depending on battery). They will actually program over a 143-178 Mhz range (so they cover the 2-meter Amateur Band), and put out 2.5 watts with the supplied CM-23 battery. Have CTCSS tones, repeater lockout, time-out timer (all programmable) and power save feature. Radios come with rubber antenna and belt-clip.

Note: These radios are NOT rated as Intrinsically Safe

---

239 (qty) GEC-Marconi MASC Speaker/Microphones:

These speaker-mics are designed with built-in Voice Privacy and are used with the Motorola MT-1000 (or its European equivalent, the HT-600E) handheld radios. With these speaker/mics attached, voice privacy can be easily retrofit to the Motorola MT-1000 series of handheld radios.

---

147 (qty) GEC-Marconi MASC internal retrofit voice privacy kits:

These kits add an internal voice privacy module to the Motorola HT-600 (US versions) family of handheld radios. These kits replace the front speaker panel of an HT-600 with a new one which contains a voice privacy module. These must be installed by a trained technician. They are compatible with the GEC-Marconi speaker/mics above, but NOT with the DM8000 Digital Encryption in the Icom IC-H10SR.

Required Accessories:

Two GEC-Marconi Keyloaders are supplied in this lot, to allow the loading of encryption keys into the scrambler/encryptors.

The Icom EX-704 programmer (required to program the radios) and the BM-71U/E desk rapid charger for the batteries are not included, but are available (along with other accessories such as headsets, speaker/mics, batteries, and DTMF encoders) directly from ICOM or one of its dealers.

Only Bids for the entire lot will be accepted. The winning bid is exclusive of shipping and insurance. Minimum bid is $75,000 for the lot.

Initial contact via E-Mail (prografx@teleport.com).

Bidding Closes June 30, 1995, and bids will not be accepted after midnite June 30, 1995.

All products are brand new, in their original factory packaging (save for a few samples or test items).

Hello,

I need a very simple tranmsitter and receiver to use as a telemetery unit.
Range needs to be only approx 1/2 mile. If you have hardware that will do
the job with little or no modifications, and you are willing to sell it,
please let me know.

Eric D.

5321. How to determine an HT's battery output power?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-20 00:00:00 UTC
From: shen@pt9245.ped.pto.ford.com
Message-ID: <3s6lsb$43j@pt9201.ped.pto.ford.com>
Source record: 216297

I have a Maxxon GMRS 210+3 GMRS HT which comes with a 7.2V 600mAh Ni-Cad
of a 2.5W transmitting power. I would like to upgrade the HT to a 5W
transmitting power. So, I checked the Radio Shack's HTX 202 (the
2-meter HT) and found that my Maxxon battery slot is the same as the
HTX202. Now, the confusion part is that what Ni-Cad battery I can buy
to have a 5W transmitting power. Would someone please help me with the
following manufacturer's specifications:

Maxxon GMRS 210+3 HT Radio Shack HTX 202 HT
(transimitting power) (transmitting power)

7.2V 600mAh 2W 7.2V ???mAh 0.8 A current drain 2.5W
9V (6 AA batteries) 3W 9 V 0.95A current drain 4 W

10.8V 600mAh 4W 12V 1.0 A current drain 5W
13.8V (car batter) 5W 13.8V 1.1 A current drain 6W

Thanks!

-pius

: Monty,
: Have you tried the ARRL Handbook? It gets pretty technical
: in spots. The ARRL puts out several other books that specialize
: in different areas. Most of them get into the science of how the
: things work. It (the handbook) goes into, or at least used to,
: how tubes work, (remember those?) transistors, and a very good
: section on propagation. I don't have the new one (1995) but the
: ones that I do have don't discuss the test questions at all, just
: theory, a little on rules/regs, a little on the history amateur radio.

: Kevin Muenzler, WB5RUE
: I am not a salesman for ARRL, nor do I play one on TV
: "I am Voltohm of Borg! Resistance is E/I, Power is EI, you will
: be attenuated!"

The Handbook is a great place to start. The further advantage is that as
the "student" gets more educated then there are more technical
explinations as well as simple. QST has over the years run a great series
of arcticles for beginners. Try your local library for back issues also
there may be transcripts in the archives at oak.oakland.edu.

Source record: 216299

The level of the input signal must be increased for the CW mode. You
need about twice the level that the other modes take. Machine sent CW
should be decoded quite well. Hand sent will vary according to the
operators skill.
Good Luck,
Rod, KI7ZI

5324. HT's make lousy aircraft receivers

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-21 00:00:00 UTC
From: dan@guardian.tessi.com
Message-ID: <3saleu$6oi@guardian.tessi.com>
Source record: 216150

In summary to my inquiry as to how well the new breed of HT's work on the aircraft band, the global response was that they work poorly due to antenna and front-end limitations. It seems the mobile and base radios do not do a very good job either. I did not receive any feedback from anyone using an aviation band antenna, and most responders said that intermod is a problem and sensitivity is very poor. My requirement is to replace my ICOM A21 with something smaller whilst I spend the day playing 'airport bum'. It would be nice to hear the local aircraft chatter, in a package that would fit in my shirt pocket. Ham Radio Outlet was unwilling to allow a return policy if it didn't meet my needs, and they assured me that it 'picks up airplanes'. What that really means, is open for interpretation. Hearing all aircraft at the same time, meets their criteria, but certainly not mine, and I would require some selectivity.

If there are other observations please let me know. I was really excited to be able to combine the ham/aircraft functions in one radio, but the opinion is that the hardware isn't yet up to this capability.

Hello All....

I'm currently running a Wildcat! BBS for the Solano County Office Of Emergency Services. We are
looking for software which can allow users to call on a land line and then go onto packet from the BBS.
The software will need to run as a door program through Wildcat! BBS software so we can limit
access. If anyone knows how I can do this or where I can obtain the software from please Email.

Thanks...

>
>Steve Smith KBOSZF
>
>
The TM-241A is a cheaper made radio with bad intermod specs and is now
made in China to save cost. (The older 241's are better) The Icom
IC-2000 is a little better but it also has some problems with quality.
Look carefully at the construction. On the bottom cover, their is only
one screw holding the outside cover on. Only One screw! Next, look
inside. The main circuit board contains 5 screw holes but only two
screws are used. Last but not least, the radio body does not have any
black paint. The Yaesu FT-2500M has the best intermod specs in the
recent QST comparision. It is the same radio as their commercial radio
division sells except it has a different face plate. In addition the
FT-2500 includes a back-lit DTMF mic.

The HW-100 was the forerunner to the HW-101 and SB-102. From what I remember, it uses (2) 6146B final amplifier tubes and will provide a power input level of approximately 180 watts SSB and CW. It covers the 80, 40, 20, 15 and 10 Meter ham bands only. It is an entirely tube-type design and both mobile and fixed power supplies were available from Heath.

In my opinion, this rig is a little too old and "featureless" for primary use. However, considering that you acquired it for free, it might be worth reconditioning for backup purposes. I would be very cautious about spending more than $50-100 to get the rig into good working order. Attending local hamfests will help to control costs, particularly if the rig needs to be re-tubed.

Source record: 216234

I recently heard on the ham radio & more shortwave broadcast about a PC card that you can install. Its an HF transiever with software to operate it.

It looks VERY nice, and is pretty reasonable for $.
($400 range)

Supposedly you need some sort of amplifier for it though, so I dont know what the added cost would be.

I would like to know if anyone has one of these, and what they think, and what peoples opinions are.

I am trying to get into HF, and would like to get an HF radio that has good coverage and good features, but a minimum of $600-1000 for a radio is kind of pricey.
I have a 386 at home already, and this board would hopefully give me very nice performance for around 4-500 bucks maybe.
Plus it expands via software for free - its like a radio that expands as time goes on for free... just download from their bbs.

If you want to know about this board, you can call them at 619-599-0476.
They also have a bbs at 619-599-0185.

Check it out, and let me know what you think.

If you have any other suggestions for an HF radio, please let me know - im looking to get into one, but am wary of used stuff because im worried about the quality/condition of what im getting.

Any help is VERY VERY appriciated.
THANK YOU VERY MUCH IN ADVANCE!

5350. Problm/w Kenwd TH78a battery contacts

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-21 00:00:00 UTC
From: daparish@biivax.dp.beckman.com
Message-ID: <1995Jun21.105609.2218@biivax.dp.beckman.com>
Source record: 216240

I have a th78a just about a year old, in great condition except for one niggling problem - the battery does not make good contact with the main body. During operation it will often shut off, and only comes back on by pressing the battery up into the case. (the battery doesn't come out of the case and is fully engaged with the battery latch the whole time, it just needs the extra pressure). I've examined the contacts on the battery and the radio, both look pretty clean, I've tried the battery in other radios (no problem) and other batteries (same problem). This problem caused it too loose its programming (200 channels!) when it turned off then on when I happened to be pressing the MEM key (=factory reset). That was a full evening of reprogramming.
The contacts inside the radio look fine (not flattened or anything) also they do not appear to be loose.
A friend said he had had the same problem with a new th28 and had slightly bent up the contacts in the radio.

I'm just a little leary of bending the contacts, since the contacts are a V shape with both sides of the V attached to the radio, it doesn't look as though they would bend easily, and previous experiences tell me once they are bent they may never the same shape again (end up mal-formed).

Anyone else experience this type of problem with a kenwood and or have a suggestion.

Bob

Just out of curiosity, how old is your 202? I've heard of some problems with older 202's, where after attempts were made to repair, RS just replaced them with a new rig. Also, do you know what specifically failed? I think many of us 202 owners may be interested. I sort of look upon the 202 as an experiment, as I believe RS is testing the waters to see if basic ham radio gear can be sold in today's market, given the influx of high-priced/mega-featured rigs. I also believe they're attempting to capture a market of increasing numbers of no-code techs. After all, the bottom line is still $.

ARLB058 FCC on the Internet

The FCC has instituted an FCC homepage (http://www.fcc.gov) as an
entry point to the Commission's on-line resources.

The page features selectable buttons to go directly to high interest
items such as the Daily Digest, the Commission Agenda, Auctions, and
current rule makings.

There also is a button called ''Getting Information,'' providing a
tour of what information is available and where it can be found on
the site. It provides links to available on-line documents. There
also is a link to the FCC telephone directory.

A general mailbox for electronic mail to the FCC is:
fccinfo@fcc.gov.

I have the following for sale/trade:

Swan Cygnet 270B Tranceievr w/ hand mic
- This is a good rig that I used exclusively on 10 meters. It
may need a new tube or two, probably a final since the output
power has been steadily decreasing.

Haethkit HM-2140 Dual HF Wattmeter

Homebrew 10-meter dipole antenna less end connector

Misc Amateur Radio magazines

I have the manuals for both the rig and meter, and they both worked
fine the last time I fired them up. I would be willing to piece it
out, but would prefer to sell the whole package. $200 or best offer.

I would also be interested in trading for the following:
Commodore 128D computer, 14.4+ modem, CMD Swiftlink cartridge,
Atrai Jaguar video game system, a portable analog recorder/mics for
recording live shows, etc.

If you have any question, don't hesitate to e-mail me. Thanks!

5367. Problem with Standard 628A, Common?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-22 00:00:00 UTC
From: rpmackin@ashley.business.uwo.ca
Message-ID: <3sbovd$7n1@falcon.ccs.uwo.ca>
Source record: 216158

I lost a Standard C628A back in February, (vanished, along with my cellphone, a couple of mobiles, and anything else light and expensive looking in my vehicle. Oh yes, I lost a door window as well, but I digress.)

The FIRST replacement radio over deviated on 440 and cut in and out due to intermittent PL decode. So back it went. Twice. The deviation problem was fixed the first time, but the PL decode was still flakey, especially when T.SQ. was set in both 440 and 1.2 bands. So now I get a replacement (second replacement that is) and it has the same PL problem.

I bought the 628 and a 228 in Dayton anout 5 years ago. They are beautiful radios, feature rich, and considering they came out 5+ years ago, and still sell to compete with current release radios, are quite remarkable. But I am really getting disheartened about this problem. (I told the dealer if they can't get me a working 628, I'll go with the ICOM X21AT (?)

Has anyone else had this problem with the 628 ? Is there a fix ?
The 628 is keyboard mod-able for 800,900,1200,1300 rx. Can the ICOM rx 800 and 900 as well as 1200? (I never found 1300 rx too useful)

I am interested in the ICOM if it has the expanded rx, anyone know the mod? (if there is one)

thanks...

Stan, I have two Ford trucks, unfortunately F series. My gas 1990 F-150 with V-8 had only a problem with the tachometer on tx (with a kW on HF) and some fuel pump noise on RX. My new 95 F-250HD with the 7.3 litre turbo charged Power Stroke engine has absolutely no tx problems but the fuel injectors tick in the rx. I lowered the interference by bonding the engine block, cab, and exhaust to the frame. This probably won't help much on your choice unless you step into a bigger truck or similar electronics (EEC modules) are used. 73 Tom

it may never be up to the performance of say something like a Collins
VHF-253 or VHF-251. The radio is an amateur radio first. That it happened
to be able to tune aircraft and include an AM detector and has marginal use as
a monitor receiver is secondary to the primary purpose of the radio.

the VHF-253 makes a lousy 2m FM receiver too. the FM detector gets used
for the squelch circuit...8)

I swapped mine for a Standard. The Yaseu had lots of nice features, but some bad ones that I decided I could live without:

Of course this is just my humble opinion but:

1. The audio was of poor quality and not loud enough for mobile use.
2. The memory stored the power setting. This was great if you used the radio from the same location, as it let you set the appropriate power for each frequency, but LOUSY if you use the radio from different locations.
3. Some of the characters on the screen are too small to be seen.

I have been very happy with the Standard.

What a lot of blathering nonesense! I hold a No-Code Tech license. There's no
way I'd ever be interested or desire to seek code privileges. Just not my area
of interest. I am heavily involved in providing emergency communications as a
volunteer in one of the busiest Wilderness Search & Rescue outfits in the
Nation. I'm the Control Operator for 3 mountain-top repeaters. I've been
actively fixing and installing radios for quite a few years now. Most recent
is the new 224.300 repeater at over 9000' in the Catalina Mountains. I'm
a NARTE Certified Technician and hold a GROL+Radar from the FCC.

Oh yeah, I've also built my fair share of antennas over the years.

So what am I missing to make me a "real ham"?

Morse Code huh? Gimme a break!

Chris Weddle, N7RME

I've certainly done that at airports and airshows with my DJ580. It's clearly not as sensitive as a good airband radio, but most of your targets are LOS and not that far out. It's fine for listening to the ATIS or Ground and tower frequencies to see what happening, and I've heard local light aircraft report their positions when they are 10 miles out and up 2000 ft.

Ham Radio Outlet was unwilling to allow

I've not had intermod problems at LaGuardia or Pittsburgh, YMMV.

In all the ham rigs, and most of the scanners I've played with , the AM detector has less gain than the FM one, so you get noticibly quieter output. But they seem to work. The selectivity seems adequate to the channel spacing in use. The front end sensitivity is often down considerably from the in-band figures, but even so, you can hear a lot of stuff. (I'm sure it varies from one vendor/model to another) I've found that if I flip it on in the car and wait to hear all kinds of exotic stuff from planes far away, I'm dissappointed. But if I'm someplace where I know the frequencies and the activity of interest is local out to say 5 miles or so, it's adequate to the task. It's definately a comprimise, but in a lot of cases it's fun.

Why not use the A21?

5375. Yaesu FT-2500M MARS/CAP mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-22 00:00:00 UTC
From: erik@csn.net
Message-ID: <3sca5m$ofj@news-4.csn.net>
Source record: 216166

Does anyone know the modification to make the Yaesu FT-2500M transmit outside the ham band for MARS? I have a friend (without internet access) who has this rig and needs to do the mod. I am also thinking of getting this rig.

Thanks in advance and 73 de KG0XE,
Erik

From: geoffs@onr.com
Message-ID: <3saj7k$o1g@Sierra.onr.com>
Source record: 216167

I posted a similar question to this on the rec.radio.swap group and got a response but I'm looking for more info. Thought that I'd try here.

I found out that a company called J-Com imported the Mizuho HF SSB/CW handies until fairly recently. Anybody know who, if anyone, picked up the line in the US? How much are these things going for these days? Are they worth having?

E-mail to: geoffs@onr.com. Thanks in advance.

5377. Something GOOD about Yaesu service!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-22 00:00:00 UTC
From: ddepew@cmt.chm.tec.sc.us
Message-ID: <1995Jun22.143126@chm.tec.sc.us>
Source record: 216168

There have been a lot of posts about Yaesu's service. Well, here's a good comment.

When my FT101E began having xmit frequency stability problems, I sent it off to Cerritos for a workover. Not having the original box to ship it in, I packed it up as best I could and sent it off. They were very prompt in acknowledging receipt of the unit, responded positively to the one phone call I made to check status, and returned the unit in a much more substantial shipping box (inner plastic seal, wrapping, then special foam injected around the unit. The repair was flawless...they fixed the problem and also did a complete realignment...sent me the "bad" parts in a sealed plastic bag...all for $150 plus S&H. So I guess every company has its good and bad points, but my experience with Yaesu USA was very positive.

Thanks and 73,

>covered by a waranty or not.

The HTX-202 is known to be rock solid reliable. There is a known problem.
You should never run 13.8Vdc with the rubber ducky. Or it will fry
eventually. Run 13.8Vdc with 1/4 wave or 5/8 wave antenna and no problems.

The sheer volume of these radios also dictate that you will also hear of
a lot of failures. That can be misleading when comparing to others with
1/10 the sales volume.

The HTX-202 is a modified ICOM AT-22 design, manufactured by Maxcim
for Radio Shack. If you bash the HTX-202, you bash ICOM.

In case everyone hasn't found this out yet, on the Icom IC-W2A HT, pressing (and holding) the function key and then the light key (3) will cause the display light to stay on constantly. Pressing the light key (3) will turn it off.
I guess this would be a great trick to pull on someone you don't like to wear his/her battery down (or you just like looking at an illuminated display for a long time).

Bob,

There have been numerous posts and stories about the failure of RS's
ham radios. It's great that they always replace them, but I wish they
would build a quality radio to begin with so people would not have to
continually go through these exchange hassles. Would be nice to get a
radio that works from the time you buy it and for many years
thereafter. RS is going to have to stop buying all these poorly built
Asian radios before we will see the kind of quality we are used to from
the U.S and Japan.

Well it depends. Are you looking for a radio that was poorly manufactured to the point that it did not work when someone else bought it; or failed after someone else bought it? Of course they have been repaired (we hope) and are now available to the next owner to try their luck with it.

If this is the kind of "bargain" you're looking for, then I guess it's a good deal.

When my battery gets low on my W2A and the display starts to fail, I use the function-light capabilities to draw down the battery a little more before I put it in the drop-in charger. Even if it doesn't do anything, I makes me feel better that I am "working" the battery to get a better charge.

So at least the capability "make me feel better"

: 40-50 miles. You'l have armchair copy all the way. Listen up on the
: County Hunters Net sometimes and you can hear what I'm talkin 'bout.

: Butch KF5DE

Well... It's a bit more complex than that. 40-50 miles on HF can be
both the easiest and the most difficult kind of signal to achieve.
Don't think so? Try that 40 meter-50 mile contact at 8:00 PM local this
November. Or for that matter, on 80 in December at this stage of the
sunspot cycle. You'll be amazed at how much these bands begin to
resemble 20 on winter evenings, going long very quickly.

To be succesful in short haul HF communication day or night, year 'round
you need to be a bit band agile. 40, 80 and 160 will, of course, be
your best bets, but none of these are likely to give 24 hour access by
themselves, all year. At 40-50 miles you are beyond ground wave and
are using sky wave, so a reasonable understanding of that propogation
mode helps. And good antennas can make a *huge* difference. The good
news here is that an effective NVIS (Near Vertical Incidence Skywave)
antenna can be cheap and simple to make. Just remember that you're
optimizing for high angle radiation rather than the DX type low-angle
stuff usually striven for in most amateur HF antenna work. In NVIS
work, a cloud-warmer antenna is a good thing!

QST ran an article last January on NVIS communications for reliable
short haul work. Check it out. Good stuff on both antennas and band
strategies as I recall.

Although the TM241A is advertised to cover the aircraft band,
Kenwood does not guarantee it, so if this is a feature you
want beware.....I bought one in May, sitting at the airport
the communications from the tower to aircraft won't even
break the squelch! I complained to AES and Kenwood service
and all they would say is that this is not guaranteed and
that is about all you can expect. Yes I'm pissed and I
recently sent a letter to Kenwood asking them how they
are going resolve the issue.......sorry to ramble, in
the 2m band the Kenwood is excellent.

From: rdavis@magicnet.net
Message-ID: <3scls8$qqb@comet.magicnet.net>
Source record: 216181

I have this beautiful little TenTec Scout 555 mobile H.F. radio that I put in my car a couple of months ago. I bought the 10, 20, and 40 meter modules, mobile mic, noise blanker board, and mobile mount bracket. It cost $682 plus tax by the time I was finished. Next I bought the Out-backer Jr. for $250 and paid a machine shop $70 to fabricate a mount for my Isuzu Trooper II.

Now.... I'm in my car 30 minutes a day. I drive 8 miles one way to work. It's all in downtown traffic. Everytime I try to work mobile H.F. I almost kill my self dodging the "rat race." It almost makes me want to change jobs so I can spend more time out on the open road.

I would like to sell everything except the outbacker and mount. I may want to try this again someday.

I know trying to sell a 3-4 month old radio is not the easiest thing to do. It still has some warranty but am unsure if it is tranferable.

I would like to get $550 for the set. I know.... You can get a brand new one for $549.00. This is true. It will have one module, no mic, no noise blanker (required for mobile operation), and no mobile mount bracket. When you add those options and 2 more modules you will be up to $682 plus tax, just like I paid.

If you are interested or need more info send E-MAIL to: rdavis@magicnet.net

Thanks, Rod Davis KC4NEQ

> The HTX-202 is a modified ICOM AT-22 design, manufactured by Maxcim
> for Radio Shack. If you bash the HTX-202, you bash ICOM.

No, when one bashes the 202, one bashes Maxxon and Radio Shack.
Maxxon is responsible for the shoddy manufacturing techniques and/or
materials and Radio Shack is responsible for letting Maxxon get away
with it.

Icom may very well have had a great design. What the manufacturer
does with the plans is not Icom's fault.

I seriously doubt that RS has sold 10 times more of their 202's than
Yaesu, Kenwood, or Icom has sold of their 2 meter HT's.

The radio is attractive for the original price, but is it really worth
it for the frustration involved? Maybe this question should be asked to
those who have taken their radios back multiple times. I seem to remember
a gentleman posting here that he took his 202 back something on the
order of seven times... I think I'd have been happier to have spent
the extra $50 for the extended warranty on a radio that I didn't have
to take back so many times.

>Can anyone point me to or provide information on modifications to the HeathKit Sb221 AMplifier? I hear there are some mods for the plate supply and perhaps a couple of others.

Thanks in advance

Roger KD6CC<

Be careful with all those mods by AG6K. Some are ok but a lot are the result of an overly active imagination. The SB-220 is really pretty good as manufactured if built correctly. The only major error is the grid chokes and small mica capacitors should be removed and the grids should be directly grounded with a lug placed right at each grid pin. They were an error produced by copying a circuit from an incorrect application, and they decrease the stability of the amplifier and hurt IMD performance.

The negative rail protection (I think AG6K suggested that) is a good idea to prevent meter damage in the event of a high vacuum arc in the 3-500Zs (a common problem if the seals are leaky or if the tube anodes are not turned red to activate the getter for long periods of time).

The relay circuit operating at 120 v was a bad idea, but you can correct that with a small transistor switch (using a single NPN HV transistor) so your radio is only exposed to a few volts from the relay line.

The parasitic nichrome stuff you may read and the filament inrush stuff is just a very wild dream. Avoid it.

Read the September 1994 QST Technical Correspondence

73 from a former Heath design engineer.

Jeff,

I would suggest ordering directly from Japan. I dont know who is carrying them now in the USA. Until 2 months ago, I had been living in Tokyo for the past 3 years. I had some opportunity to check these mini rigs out and my opinion was basically good, but pricey. If I recall, the price was about US$300 for each of these rigs. The 15 meter and 40 meter version were most popular, but, Mizuho also makes an 80M verison, a 75M version, a 30M, 20M, 6M, and 2Mssb and 430ssb. The VHF/UHF are marketed under the name "PICO" in Japan. Most of them run between 2 and 3 watts out, with a superhet receiver.

Decent but you are probably better off with a kit due to cost.

For Sale:

*Kenwood TS-830S Radio Transciever

*Works great, digital tuner and display
*Well taken care of only using transmitting antennas with SWR 1:1
*Powerful amplifier delivers clean signals approx 100W (adjustable downward)
*Reciever section picks up even the weakest transmissions with
variable gain, squelch, and tunable notch filters.
*Large flywheel type tuner knob and complementing fine tuning dial
*Integrates with RTTY and TV mode transmissions systems
*Analog transmitting power and reception displays

*Used many times on Amateur Radio bands, voice sideband and morse code
logging stations around the world.

Why I'm selling this good reliable:
*Only used occasionally, bought from a reputable Amateur Radio supplier
*Has been in storage for a few years in the original packaging in the closet,
haven't afforded much time in enjoying the hobby. The radio would serve
someone else better than me in storage.

This is an excellent radio that gives a novice user immediate flexibility
and freedom. Also is a nice addition for experienced hams who want
the power and options you find on the newer rigs with the fancy buttons
and displays at much higher retail. The TS-830S is a performer that
delivers just as clean a signal over the bands.

Give me your best offer on a lean and mean rig that is all muscle and
business.

From: sherdev@iaccess.za
Message-ID: <sherdev.3.00058D04@iaccess.za>
Source record: 216189

hi and thanks for reading this message.

i would like some advice based on the following criteria.

i need a h.f. transceiver with 100wt output that can be mounted permantly in a Toyota Landcruiser preferably with a removable faceplate.
i have mounted already on the vehicle a hf mobile antenna with coils for 40m & 80m,and the radio must be capable of operating on all the amatuer bands either direct or via an atu, maybe with the antenna setup supplemented by a non loaded long whip.

I live in South Africa and the local brands available are Icom,Kenwood,Yaesu & Alinco.

If you can assisy me please e-mail me

thanks
Tony Campbell

Well, if you are receiveing four different cw tones at once the human ear picks
out the wanted. Try making a cumputer based decoding system doing that...

digital signal processing. take the problem to the frequency domain.
there you can see the 4 tones as discrete items. with enough processor speed
it should be possible to decode all 4 at once. might even be able to track
transmitter drift and rate the sender's consistancy. how's that?

aircraft radios have morse decoders in them - granted there's a lot that's
supposed to be known about the signals (rate, frequency, weighting, etc.) but
the designers have to be fairly tolerant since the sending equipment seems
to vary quite a bit from the spec.

Hi Dave... Tom here, since I own an use both; I feel comfortable airing my opinion of them...

Kam+ : Is a good small all mode unit, with a number of software progams that work well with it. Mine was an old version , I have had up dated. Hate the HF din plug <would have preferred db9 plug as in the vhf/uhf port> Also had to add VR pot to adjust audio level to Tx input for my TS-690 <needed lower output> but needed higher output for my FT-990... I take it with me where ever I go...

PK-232MBX with pactor upgrade: Its my favorite home unit <due to its size> Also had to do various mods for the DC input <12.5v>... These were done to keep rf out of the tnc on the DC line input. On HF the rf would get back into the unit more then the KAM+. Neither unit has much protection on the DC line; but PK232 was more of a pest...

For myself: the PK-232 is my most used unit at home. The Kam+ makes a good small portable unit great for traveling an field use. I have a tendency to like the AEA over the Kantronics but not for any major reason. There are just so many of them in use; that if you where to have a problem, you would probably find help on it very quickly.

The Kam+ had a problem with its 7.0 version, but was fixed in a 7.1 patch. The G-tor mode of the KAM is a nice additional mode that only works between KAM units. I don't of any other rig able to run G-tor.

The AEA units <mbx type> are upgradeable quite easily and are very dependable. The Kam types are also up gradeable but to me at a slightly higher cost. They are both very good units an have a lot of pro's an con's. There are plenty of software for both units. I use Lan-link 2.32 for the Kam an PCpakratII for the 232. Hope this gives you a few points to ponder... De Tom KD4QHH 73.

> Any suggestions most appreciated. 73 from Rob in Afrika.

Hi Rob... The 232 <or any Kam, MFJ & ect> are only so reliable in recieving CW due to the inconsistancys of their sending operators... You must also be sure to:
center the band pass, rit, if shift an notch off before tunning in a signal. Try tunning in either W1AW or any of the commercial ship/shore automated cw signals to get the feel for the tunning. You should be able to some local info about their operating scheduals an frequency. The tunning is very touchy depending on the sound coming from your rig... The 232 is very narrow on its preferred Rx audio; watch the tunning bar... As you tune across the signal, it should dart to the right <as far as possible> as you come across the correct audio range for the 232. Keep your volume level to the 232 low enough - so as not to be affected by qrm or qrn. Initially do not use your narrowest cw filter until you become more adept at the tunning. Even then there will be some cw-ops that you will not be able to tune in, due to their keyer or fist... Sorry, them you will have to copy by ear. Hope this helps... De Tom KD4QHH 73.

> my shirt pocket.

I've certainly done that at airports and airshows with my DJ580. It's clearly not as sensitive as a good airband radio, but most of your targets are LOS and not that far out. It's fine for listening to the ATIS or Ground and tower frequencies to see what happening, and I've heard local light aircraft report their positions when they are 10 miles out and up 2000 ft.

Ham Radio Outlet was unwilling to allow
> a return policy if it didn't meet my needs, and they
> assured me that it 'picks up airplanes'. What that really
> means, is open for interpretation. Hearing all aircraft

> If there are other observations please let me know. I was
> really excited to be able to combine the ham/aircraft
> functions in one radio, but the opinion is that the
> hardware isn't yet up to this capability.
>
> comments ?

In all the ham rigs, and most of the scanners I've played with , the AM detector has less gain than the FM one, so you get noticibly quieter output. But they seem to work. The selectivity seems adequate to the channel spacing in use. The front end sensitivity is often down considerably from the in-band figures, but even so, you can hear a lot of stuff. (I'm sure it varies from one vendor/model to another) I've found that if I flip it on in the car and wait to hear all kinds of exotic stuff from planes far away, I'm dissappointed. But if I'm someplace where I know the frequencies and the activity of interest is local out to say 5 miles or so, it's adequate to the task. It's definately a comprimise, but in a lot of cases it's fun.

Why not use the A21?

Subject: Mizuho HF HT Info Wanted

Jeff,

I would suggest ordering directly from Japan. I dont know who is
carrying them now in the USA. Until 2 months ago, I had been living in
Tokyo for the past 3 years. I had some opportunity to check these mini
rigs out and my opinion was basically good, but pricey. If I recall,
the price was about US$300 for each of these rigs. The 15 meter and
40 meter version were most popular, but, Mizuho also makes an 80M
verison, a 75M version, a 30M, 20M, 6M, and 2Mssb and 430ssb. The
VHF/UHF are marketed under the name "PICO" in Japan. Most of them run
between 2 and 3 watts out, with a superhet receiver.

Decent but you are probably better off with a kit due to cost.

The HW-100 was the forerunner to the HW-101 and SB-102. From what I remember,
it uses (2) 6146B final amplifier tubes and will provide a power input level
of approximately 180 watts SSB and CW. It covers the 80, 40, 20, 15 and 10
Meter ham bands only. It is an entirely tube-type design and both mobile and
fixed power supplies were available from Heath.

In my opinion, this rig is a little too old and "featureless" for primary use.
However, considering that you acquired it for free, it might be worth
reconditioning for backup purposes. I would be very cautious about spending
more than $50-100 to get the rig into good working order. Attending local
hamfests will help to control costs, particularly if the rig needs to be

re-tubed.

Subject: Packet Software for BBS

Hello All....

I'm currently running a Wildcat! BBS for the Solano County Office Of Emergency
Services. We are
looking for software which can allow users to call on a land line and then go
onto packet from the BBS.
The software will need to run as a door program through Wildcat! BBS software
so we can limit
access. If anyone knows how I can do this or where I can obtain the software
from please Email.

Thanks...

Subject: SOLID STATE HF AMP QUESTIONs

Has anyone used or had experience with the Ameritron solid state HF amp,
the Ten Tec solid state amp (cant remember the model #), or the Icom
IC2KL solid state amp? I'm looking for an amp of about 1/2 KW and think
the solid-state route may be the way to go. Curious about the following
quesitons:

1. What voltage and current do these amps draw
2. How is the SWR protection and durability of the finals
3. What about price for buck including the following
- cost per watt
- cw full breakin (qsk) performance
- durability, etc

I'd also consider a single 3-500Z or an 811A based amp (like 30L1,
Ameritron, etc) but wanted to price-compare with the solid state ones.
Seems the tube amps are much less expensive. Any comments? Could I
build my own? Mostly interested in 40-cw and 20-cw so QSK is important.
Thanks,

Subject: Yaesu FT-900 Serious Factory Problem

I have just purchased a new FT-900 and I really like it except I noticed
that once the radio is turned on it has a tendency to turn itself off.
Sometimes it will stay on for hours and mysteriously shut off by itself.
Since I use the radio as part of my remote base the problem causes the rig
to be off when it is supposed to be on this is a real problem. Since there is
no remote control capability to turn it back on I am stuck. I have talked to
Yaesu and they did admit to the problem and they said that the problem has
surfaced in a number of the FT-900 radios. And they are not exactly sure
what is causing it. They recommended major surgery (change out the 128
pin Microprocessor that is surface mounted). They suggested that this seems
to fix the problem but it may not fix it. That sounds a bit bazzar for a brand
new radio. Anyone else have this problem and resolved it in any other
way??? Let me know. Thanks NI6R Bob B.

>out the wanted. Try making a cumputer based decoding system doing that...

digital signal processing. take the problem to the frequency domain.
there you can see the 4 tones as discrete items. with enough processor speed
it should be possible to decode all 4 at once. might even be able to track
transmitter drift and rate the sender's consistancy. how's that?

aircraft radios have morse decoders in them - granted there's a lot that's
supposed to be known about the signals (rate, frequency, weighting, etc.) but
the designers have to be fairly tolerant since the sending equipment seems
to vary quite a bit from the spec.

Hi hams,

I'm the (happy) owner of a TS-50. However I'd like to expand the tx-range because the bandsegments available will change in the near future (more on 160). Does anyone know how to do it????

Also, has anyone experience with computer-control of the TS-50?. What software do you use and how do you like it?

5416. FT900 Factory Problem Solved

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-23 00:00:00 UTC
From: "Robert Blumenkranz (Ni6r)" <radiobob@earthlink.net>
Message-ID: <3sencd$p8@mars.earthlink.net>
Source record: 216107

Original Problem Reported by me:
I have just purchased a new FT-900 and I really like it except I noticed
that once the radio is turned on it has a tendency to turn itself off.
Sometimes it will stay on for hours and mysteriously shut off by itself.
Since I use the radio as part of my remote base the problem causes the rig
to be off when it is supposed to be on this is a real problem. Since there is
no remote control capability to turn it back on I am stuck. I have talked to
Yaesu and they did admit to the problem and they said that the problem has
surfaced in a number of the FT-900 radios. And they are not exactly sure
what is causing it. They recommended major surgery (change out the 128
pin Microprocessor that is surface mounted). They suggested that this seems
to fix the problem but it may not fix it. That sounds a bit bazzar for a brand
new radio. Anyone else have this problem and resolved it in any other
way??? Let me know. Thanks NI6R Bob B.

Yeasu fixed the problem:
The above problem has been fixed by Yaesu witht he installation of a new
microprocessor. This represents a software change for the FT900. Although
I am told that the problem was not found in all units I suspect that it may
not be noticed, because of the software bug that the new micro fixes. This is
not a problem that you will notice unless you use the radio alot. If you find
the problem let Yaesu fix it before the warrenty expires.

I plan to buy one or two antennas and I'd like to hear comments
from those who have used the following:

MFJ 1730 Pocket Roll-up 2m antenna
I do quite a bit of wilderness canoeing and backpacking. I
take the HT along for emergencies. The duck is worthless
over long distances and the telescoping antennas are usually
too long, even when collapsed. Is this J-pole going to give me
comparable performance to a telescoping antenna such as the AEA
Hot Rod?

Comet SH-55 and Diamond RH-77CA
For everyday use. I'm hope I could do much better with these
than my standard duck. Are these antennas worth $32 or is the
gain increase from a factory duck negligible?

(Curiosity only)
Comet CH-32 Miracle Baby
Says it can handle 10W but I'd be worried about burning up my
radio with this. Do they work? Are they safe? Nothing like
having the entire antenna 2 inches from your eyes.

Please share any info or experiences you may have with these
antennas. E-mail appreciated but I will also check here
periodically for replies. Thank you very much.

5422. r71a repair help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-23 00:00:00 UTC
From: kenb@qatrix.lonestar.org
Message-ID: <1995Jun23.132732.30779@qatrix.lonestar.org>
Source record: 216113
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment

i have a ~10 yr old r71a. about 6 years or so ago it developed an annoying problem such that if i leave it off for a week or so, when i power it up again the display is a bit brain-dead. the memory channel indicators tend to track the LSB of the frequency display. power cycling does not help this problem (although it does cure another), but leaving the radio on for several hours and then power cycling it will cure it. it'll be ok as long as i use it every day or two. i remember reading about a display board tant problem, but have lost the reference.

another problem is intermittant audio distortion. once it starts the only way to cure it is to power cycle the rig. it may take a couple of trys to get it to power back up. this feels like a power supply problem.

btw, i don't believe this to be a ram module problem. the battery has been changed and still delivers good voltage.

i hate to reinvent the wheel. before i dive in, i'm looking to see if anyone has experienced similar problems with their 71's and what they did to cure them. a search of the various mod databases and veronica hasn't returned anything useful.

any comments are welcome! thanks!

>I guess this would be a great trick to pull on someone you don't like to
>wear his/her battery down (or you just like looking at an illuminated
>display for a long time).

>73, Bryce, AL7DL (Packet: AL7DL@AL7DL.ALAMO.NM.USA.NOAM)
> (e-mail: al7dl@ki5pi.nmsu.edu)

I sent this 'feature' out as 'useless' with 'tongue in cheek'. There is always a use for everything. Some of you sent me some rather unique uses for the feature. Just so the few flamers will understand... What is useless to one may be of value to another. If you think the feature is not useless, send some ideas for use rather than just 'you lack imagination and experience', with no ideas for use.

In addition for the 'uses' listed in the above message:

1. Use for illuminating the display while mobile (and on external power). (Thanks to KC5EJK)

2. As a way of draining the battery in preparation for charging (just don't get the battery too low). (I don't remember who sent that in, sorry, but it's a good idea, anyway. Let me know so I can give you credit!)

3. As an emergency, low power flashlight (for finding keys, etc.).

4. As a signaling light.

5. As a warning light while walking or cycling.

6. As a way of finding the HT in the dark when there is no RF signal present.

Items 3 - 6 are just some thoughts rolling off my head while I am typing this.

There are dozens of uses for the constant light, however, I, in my humble opinion, (and again, it's only my opinion, not that of anyone else (that's for those that believe when someone considers something useless they lack experience and imagination)), the constant light is of little or no use to me.

'A horse and buggy is useless in light of the modern automobile (until the blasted car breaks down).'

73, Bryce, AL7DL (al7dl@ki5pi.nmsu.edu)

PS Now, how about some more uses for my 'useless' feature???

: >My brother gave me a Heathkit HW-100 (SSB) including a final.. What
: >is this unit capable of? Is it a decent unit? Is it worth getting in
: >shape?

: The HW-100 was the forerunner to the HW-101 and SB-102. From what I remember,
: it uses (2) 6146B final amplifier tubes and will provide a power input level
: of approximately 180 watts SSB and CW. It covers the 80, 40, 20, 15 and 10
: Meter ham bands only. It is an entirely tube-type design and both mobile and
: fixed power supplies were available from Heath.

: In my opinion, this rig is a little too old and "featureless" for primary use.
: However, considering that you acquired it for free, it might be worth
: reconditioning for backup purposes. I would be very cautious about spending
: more than $50-100 to get the rig into good working order. Attending local
: hamfests will help to control costs, particularly if the rig needs to be
: re-tubed.

: 73,

: Jack WB3U

I have one and would have to agree with Jack. I'd even be leary of
spending $50 to get it on the air. The VFO in those things is
terrible for a number of reasons. I could never get the radio
to behave on 15 meters. Also, the receiver is not too healthy
on 10 meters. So..it's a great 75/40 phone rig and that's about
it. Make a good rig for phone at a cabin or something, but that's about
it. I've been parting mine out for folks that need tubes.

Of course, what's HF anymore? Anything below 400 Mhz isn't worth the
effort. Why did I upgrade from tech. anyway?

Good luck with the HW100. You can have some fun with it, I'm sure. Good
for field day abuse, too, I might add. Impossible to destroy...loads

into anything, too.

Let me know if you have any questions. I also have the full manual.

73,
Brady
WB0VFW

|> display for a long time).

Well, it's nice for mobile operations when you're hooked to external power.

It's good for night-time T-hunting when you have to watch the S-meter for a long period of time.

The meter light doesn't seem to draw much power. I've left it on for hours while t-hunting using a small (650mAh) ni-cad pack.

BTW, if you set the display light to "constant on", the radio will remember this status even when it is turned off. The light will come back on the next time you turn on the radio. If it happens to be in daylight, you can't see the dial light.

I wouldn't really call it "useless" :-)

I just bought one, so I know a little about this......

Prices for the rig and matching speaker range from $500-$650. With the
matching digital remote VFO add $150. (US)

It is a nice rig. Solid 150+ watts out on 160-30 meters (the only bands
I've tried it on to date).

IC-735 is vastly superior to TS-430. It has better intermod
properties, 3rd IF (455KHz) filtering, power adjustment on SSB, and
well protected finals that are hard to blow up. Other IC-735 niceties
as compared to TS-430 are passband tuning, full BK, 12 rather than 8
memories with better handling, SWR metering, and smaller size.

5429. Re: KAM Plus or PK232

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-23 00:00:00 UTC
From: sherwood@oribi.cig.mot.com
Message-ID: <3sefvo$hfm@newdelph.cig.mot.com>
Source record: 216120

Pk232 vs Kam+

I have used an older PK232 and a new Kam+. I prefer the Kam+ for
several reasons.

I could never tune the HF radio using the LEDs on PK232. I needed a on a scope
attached to it. I can tune the HF radio easily using the LEDs on the KAM.

The old PK232 drew about 1 amp at 12 volts. The kam pulls abt .25A, although
I think the spec is 0.3.

New units are very closely priced and the Kam gives you Gtor as a bonus.
(at least when I bought mine, several months ago)

Also the Kam is dual ported. You can run both vhf and hf at the same time.
The 232 is not. (not a big deal in my opinion)

My 2 cents worth.

>a gentleman posting here that he took his 202 back something on the
>order of seven times... I think I'd have been happier to have spent

true, but also he could take the radio back locally. not having to run down
to UPS or FedEx, ship the radio, they have to examine and tinker with it
at the far end, decide you were right, and ship back a new OK radio....

there's something to be said for having the local store right there.

what could be happening (but shouldn't) is that a bad radio comes in and
gets turned around and resold as new...might account for some of the problems.

Hi Guys, my friend called Icom and got the expanded receive mod,
I thought someone might be interested so here it is:

Press and hold B and # (at the same time), while holding those
buttons turn the radio on. To get full frequency direct entry,
go into the set mode, and page through until you find a new
setting called PL (place). You can choose 1, 10, or 100 MHz
frequency entry by rotating the dial so the display shows it.

I am still interested in finding out the expanded transmit mod,
and cross-band repeat mod if there is one. 73 de,

>

Leon,
I have a IC2700 and have no problem with selectivity. The only thing that
I wish was a bit better is the Intermod. However,
the intermod is typical for a dualband radio (ie Kenwood, Alinco, etc)
I really like the IC2700.

5455. [REQ] Help needed for Moto. Syntor X9000 UHF on ham freqs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-24 00:00:00 UTC
From: jecolina@interramp.com
Message-ID: <jecolina.36.0002AA5A@interramp.com>
Source record: 216137

I have a Syntor X9000 UHF which I would like to get on ham frequencies. Anyone who has done please, I need your advice. I have all that is needed to program it. Unfotunately the software won't allow me to program below 447.000 Mhz.

Help that ultimately leads to my being able to put this radio on ham frequencies will be rewarded with extreme appreciation and a 32 channel Syntor (T34SRAxxxx).

Thank you very much.

Thanks for a good comparison. I have only the KAM and have been happy with
it except for the software -- I use the Hostmaster II+ supplied by the
factory, and it seems kind of clumsy to use. I especially don't like the
transmit buffer files. If you have Hostmaster, you probably know what I
mean.

May I ask your opinion on the Lan-Link software? Does it do the
simultaneous VHF/HF dual port operation? Any other recommendations from
anyone??

Thanks,

73, Bill W7LZP

Dan Curry tells us that out of band mods are illegal in the US
this is simply not true. You can mod to your heart's content.
MARS requires mods to get to their frequencies. Now unless you
are in MARS/CAP or other authorized service transmitting out of
band can be against the rules but there are exceptions even to this.

All you folks who want to 'guard house lawyers' might consider
reading and understanding the rules rather than trying so hard
to be net cops.

Hi Tony,
for your mobile needs recommend either the TS450SAT or the TS50S and its atu the AT50 from Kenwood. The TS50S is about as big as a car stereo and is excellent for mobile. It runs 100w but can get quite warm so put it near the A/C output in the landcruiser!!
Good luck
Maurice French @ Magnet Systems Kenwood NZ

: : accepted as true?

: You must be very carefull in this "Plastic" age all that is copper is not
: necessarily grounded! I recently moved into a 12 year old house and made
: my initial ground connections to a copper water pipe in the garage not 5
: feet below me in the garage. Later ohm meter measurements to the house
: neutral showed that the ground was not not very good .Further inspection
: revealed that there were a number of plastic pipes in the system
: including the main supply line. The ground that i did measure (about 2
: ohms) was actualy going back through the neutral connection at the hot
: water heater and the dishwasher!!!

: caveat emptor

: Dave
: N0Dh

If you're wondering how to get a pipe into the ground: it's easy! Just get
enough length (I used 10 meters), attach a hose to the upper end and dig a
small hole in the ground. Then turn on the water (via the hose and the pipe)
and move the pipe down. Gently move it up and down (of course always a

little further down than up) and you will see it disappear completely. The trick is to keep the water flowing. Use a file to create some "teeth" on the lower end of your pipe. DON'T try this section by section! If you turn the water of, you won't be able to start anew. I used my aer-tower to hoist up the entire pipe and then lower it.

73 Ben PA3DWJ

PS. You should try it just to see it happen once: unbelievable (but they use the same technique (with high-pressure pumps) to dig wells)

Bob;
Here's some phone numbers for Motorola that might help:
Motorola Parts Identification Service: 708-538-0021
Motorola National Parts Order Line : 800-422-4210

First you call the Parts ID people and they find the stock number of what you want. Then you call the Order people and give them that number. They can sell to you direct. I've found prices on service manuals to be 1/3 to 1/2 of what a local Motorola facility charges.

That's all. Good luck,
Chris

From: jds@neptune.net
Message-ID: <3sk2pt$n51@neptune.neptune.net>
Source record: 216066

A while back I posted a request for info on "classic" 6m radios.
I got LOTS of good responses, and I want to say thanks again to
all who replied.

I ended up falling into a deal for a Drake TR-6 at the last local
swap (it was very clean, and the price was too good!-).

Anyway, I haven't found time to get it on the air yet, but I will
soon (gotta scare up or wire up a mike, for instance). Prior
commitments etc.

So, I was wondering if anyone had any "lore", helpful hints,
observations, funny stories, history, etc. about the TR-6. I have
the instructions and also a QST review of the radio from July 1970.

But that's the official stuff. What about the unofficial stuff?-)

Thanks for taking the time to read this far!

I once thought it a nice small rig that I could use portable as well
as for fixed operation, but when I priced out the multiple modules
the I wanted and the other features that would cost me money, I
chose a Yaesu FT-900 instead which gave me general coverage receive,
more output when I needed, and not much bigger package.

You may want to read the Product Review in QST Dec 1993 pg 77 by
David Newkirk WJ1Z. it has some points you can ponder, both pro
and con.

I just had to replace the battery in my FT-2400, and called up Yaesu
about it.. They got the part out to me the next day, along with good advice on
how to install same. The only problem I had was that they shipped it UPS Brown
(which, since I'm in VA, took eight days) for a S&H charge of 4 and a half
bucks for a 2 dollar part.

The kicker is that the battery only weighs about 1/2 an ounce. I
wonder why they didn't just stick a 29^H^H32 cent stamp on it and send it?
Would have taken less time, too... Maybe there's a thought!

>
>A decoder for CW never beats the human ear. I sometimes use ny PK232 for
>decoding, but as I decode cw by the ear, I must say it is not very impressive.

Never is an overly broad claim, though accurate in regard to unsophisticated things like the PK-232 and the Kam. Somewhat more sophisticated decoders can work as well as the ear/brain, and under some conditions better, on OOK Morse encoded signals. Of course it takes a better encoding, IE uniform codes applied to coherent modulations, to really get outstanding weak signal performance.

To return to the original question, the PK-232 uses simple envelope detection and a non-adaptive slicer for OOK Morse. That requires a pretty high SNR as well as fairly careful setting of the audio input level in order to work well. I believe the KAM uses a hardware PLL detector, though I don't own one and can't say for sure. To get quick loop settling, that needs a pretty decent SNR too, though audio levels are less critical.

There are better ways. Of course DSP is the current buzzword, but most DSP units on the amateur market only implement audio filters. While those are somewhat better than the analog filters in the PK-232, detection is still by slicing the envelope. Much more powerful DSP techniques are possible. But there are better analog hardware techniques too. One of the best uses a synchronized oscillator to drive a sample, hold, and dump circuit. As I recall, Tonna did this in one of their units, and there have been several homebrew decoders that worked this way. They'll work with the signal right down to the noise threshold, and are especially useful on signals with a lot of QSB. That's all you can do with a OOK signal. To work with signals below the noise floor, you need coherent modulations and uniform codes.

Following a shaky fist is a different problem, and one that's easily amenable to software solutions. I wrote Z80 code years ago that could decypher "Morse" that most operators couldn't figure out. The trick is to do binning of element timings and apply a sliding decoding window over several characters at a time, IE copying behind.

If I were to do it again today, I'd also add a "book" of common spellings and misspellings of QSO-English to use to fill in holes by best approximation. Context guessing in the sense of meaning is outside the scope of decoding, and that has to be mostly left up to the operator reading the output. Much of what human operators call copying in difficult conditions is really context guessing based on fragmentary clues. That's really a separate thing.

Gary

Gee, that's simple. Just do a FFT on the signals and copy all four at
once to different data streams. Lets see you do that in your head. :-)

Several of us were kicking around that idea for next Field Day. We
should be able to copy several contest stations at once, and respond
to all of them at once by using several different tones applied to a
single SSB transmitter, each modulated with the appropriate data stream,
all while maintaining single transmitter status in the contest. I'm not
sure that's permitted by the contest rules, but it would sure be easy to
do.

>I prefer the soldered connections.

Better still, if you have the proper tooling, are the crimp connectors.
The Kings line is excellent. Applied properly, they'll support your
weight, if the coax will. When done right, crimp connectors form a
gastight seal that will not fail electrically or mechanically. NASA
uses them. The crimp tooling, tool and the proper die set for your
cable and connector, is expensive, over $200, but its a lifetime
investment.

Beware, however, there are shoddy crimp connectors and shoddy tooling
out there. They won't produce good results. You must use the proper
connector for the cable, and the proper dies for that connector. There
are no shortcuts. Kings makes a connector for 9913, and it works
beautifully. It's a tad cheaper locally than the Amphenol solder
and wrench type which I hate.

5486. DigiVFO

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-25 00:00:00 UTC
From: stratton@mit.edu
Message-ID: <stratton.44.00B0F252@mit.edu>
Source record: 216077

I just read the artice "Weekend DigiVFO" in May 1995 QST, which
which raised an interesting question.

This design uses a 12bit Harris Semiconductor Digital VFO chip
to generate sine-wave samples and then feeds them through an
8 bit DAC. Obviously, this doesn't give great spectral purity,
but it was designed to drive a Drake transceiver that filters
the signal by using it as a reference for a PLL. The PLL can
only lock onto one signal - the desired strongest one, so the
net spectral purity is that of the PLL's oscillator.

Now, I got to thinking that a PLL is based on a phase comparator,
and in order to do phase comparison you have to essentially square
the sine wave. So, why not punt the DAC and use the highest order
output of the DDS chip as a sort of 1-bit DDS to which to lock the
PLL? It would seem simpler, cheaper, and like the PLL wouldn't care
because it ultimately wants a a sharp edge to compare to, not a sign
wave.

Could anyone tell me if this approach makes sense, or if I am
still missing some part of the concept? I haven't tried it yet,
but I hope to in the near future.

5487. Portable radios needed for paragliding

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-25 00:00:00 UTC
From: Steve Ball <sball@dgs.dgsys.com>
Message-ID: <3skqdu$gus@news.dgsys.com>
Source record: 216078

Hello! I've never posted to/read (except for today) any of the posts in this newsgroup, and I don't know diddly about amateur radio, so forgive me if I'm posting to the wrong area or if I'm asking dumb questions.

At any rate, skydiving and paragliding are my hobbies and I'm looking for a pair of radios to use while in the air. The requirements are as follows:

1. Maximum reliability/quality - ie no junk, like CBs.
2. Air-to-air and air-to-ground range of at least 5 miles (I realize there are lots of factors that could reduce effective range, however).
3. Size/weight - both as small as possible.
4. Cost - reasonable, but not at the sake of any of the above.
5. I probably need radios that operate on more than one frequency, since the areas they will be used in will vary geographically as will the traffic on whatever frequencies I choose. 2 or 3 would probably be OK. Changing frequencies should be easy, ie flipping a switch rather than punching a frequency into a keypad.
6. I understand that there are FCC licencing requirements and will gladly comply with whatever is necessary,

If you have equipment recommendations/suggestions, please email them to me at: SBALL@WORLDBANK.ORG.

I appreciate your time in reading this,

Regards,

- Steve -

5488. Help Please! - Old MOTOROLA UHF REPEATER

Date: 1995-06-26 00:00:00 UTC
From: Dick Harper <dharper@kumc.wpo.ukans.edu>
Message-ID: <1995Jun26.103659.96321@kuhub.cc.ukans.edu>
Source record: 216000

Hi and thanks for reading,

I am working on the controller for a Motorola, Compa-
Station, (RT) repeater. (UHF) It is 1973 vintage.

It was working OK with PL as a community repeater. In
trying to change it over to carrier squelch it locks up
on transmit on the first reception of an incoming
signal.

According to our instructions we only needed to move
JU1 and JU2 from PL to Carrier Squelch positions on the
Squelch Gate card. We have documentation on the
Station control and squelch gate cards but none on the
Time-Out Timer card. I noticed the Time-Out timer has
a couple of jumpers: JU1 removed by cutting, JU2 is in.
Without knowing what they do we left them alone.

Any ideas on what else, ie. jumpers, might have to be
changed to get this working as carrier squelch? All
comments appreciated.

5491. MFJ 259 won't count

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-26 00:00:00 UTC
From: genunn@mmm.com
Message-ID: <3smjje$899@dawn.mmm.com>
Source record: 216003

My new MFJ 259 doesn't want to count using the external bnc connector. I tried calibrating my QRP Explorer rig with it, but it would count for about a second then fall off to 0. Counting the 259's own output (by placing the probe on its own antenna connector's center conductor) gave about the same results - count for about two seconds then 0.

It behaved the same way using a 1:1 oscilloscope probe and a cobbled up probe made of coax. It would not count at all with the 'scope probe set at 10:1. Would the probe need DC isolation? You would think this would be provided internally but MFJ does not supply the schematics, so who knows.

I don't have a oscilloscope so I don't know how big the signals were. They may have been less than the 600mv that the 259 requires. The Explorer instructions don't specify the sensitivity required, but they call for a 10:1 probe for the counter. Could anyone suggest a circuit to amplify the counter input? I would guess this would need to be a broad-band amp with very high impedance input. My ICOM IC701 requires 100mv sensitivity for its alignment procedure.

I thought this was going to be the perfect tool to keep my antennas in tune and my rigs aligned. It is great for the antennas, now what's it gonna take for the rigs?

>
> Thank you
> Lowell

And, while on the topic.....

I am using a printer buffer ("EB-120") and a serial-parallel converter ("SXP-325"), both of which are creating RFI in the 2 m band (and elsewhere). They are both Class A (Part 15) devices (which wasn't announced in the sales literature). I discovered the interference when I tried to use packet on 145.03 and encountered a swamping signal that blanked out all packet signals. A little sleuthing led to the converter. By sweeping the band I found the RFI from both the converter and buffer. The converter signal shows up at ca. 2.5 MHz intervals over the range I tested (ca. 140-170 MHz).

What would be the best ways for filtering these spurious emissions from the buffer and converter? Neither can be opened easily (they are small, "in-line" units run from AC-DC power adapter). I tried a ferrite on the power lead, and wrapped the unit in aluminum foil, but either I didn't do enough or it wasn't effective. Suggestions would be very welcome! Thanks!

>(AG6K) response to all that technical correspondence, or even
>provide an open forum for intelligent discussion. All they did (as you
>are doing) is attacking someone's research without basis.

The ARRL sent copies of his stuff to dozens of people (outside the amateur community) and they *all* agreed the data was not scientifically correct. The League took several months to review everything. I can't believe they weren't careful, because it was a lot of egg on their faces - they initially printed that stuff. In any event, I would be happy to debate it technically point-by-point in any open forum, as long as it is done one subject at a time with no wild personal attacks.

>The fact is, AG6K has done a considerable amount of EMPIRICAL
>research in the areas he discusses - how much have YOU done?

Professionally? Over twenty years, eight to ten hours a day. Education-wise 6 years. Hobby-wise 33 years.

>Gee - you don't suppose THAT has anything to do with his defense of
>the amp design, do you.....? Nah. That must just be the product of my
>overactive imagination...

That must be Greg. ;-) Actually if you re-read my post I didn't "defend" the 220 design. There actually was a major flaw in it! The flaw was even copied in the TL-922 clone of the SB-220. It was the small mica caps and RF chokes from the grids to ground. That circuit was pirated from the Collins 30S1 amplifier in error.

The 30S1 used a very clever method of preventing excessive drive to a 4CX1000 tube. It was a RF and dc high impedance control grid to chassis connection. When that AB1 amplifier was overdriven and drew grid current, the cathode/grid impedance would drop rapidly and reduce the grid to cathode voltage saving the tube.

That was a great idea, but it required an AB1 tetrode or pentode to operate properly. The screen grid was necessary to shield the RF drive from the output, since the shielding of the cathode/anode path is reduced by partially floating the control grid for RF. The circuit also requires a control grid that *never* develops grid current.

The problem in the 220 occurred when someone decided that circuit would work with a grounded grid AB2 amplifier, and put it in the 220. It unfortunately de-stabilizes the amplifier, increases IMD, and reduces gain flatness.

There certainly are other improvements that can be made to the 220, especially if people want to operate an amplifier designed to run 600 watts CW output (1 kW input) at twice the design target power! On the other hand, there is no reason to destroy sections of the amplifier that are functionally correct with voo-doo and bat wing cures of imaginary problems. That doesn't make sense.

hi Chuck

I have used both in the mobile. If you can afford the 735, get it.
the LCD display alone is worth it. You cannot see the display on the
430 in daylight unless you put your hand near it for shading and that's
pretty dangerous while in motion! Also, 735 is smaller, especially in
depth which makes mounting under the dash much neater.

Robert,

Basically, no. Gell cells are like car batteries only the electrolyte is in a jelly iso liquid that could spill. Cycling the gell cells from full charge to deep discharge helps. They have a life of about 2-3 years whether or not they are used. I used to sell them and business is good for emergency stand-by lighting.

The main thing that kills gell cells is sulphating. A chemical coating forms preventing charging. Cycling helps retard sulphating.

If you're going to buy used gell cells you might want to get familiar with the mfg's date codes.

Hope this helps,

> Thanks,

<snip>

I've had my HXT 202 for two months and the problem with the transmitt on mine seems to be in the BNC connector loosening up where is connects to the case.

My HT has developed an intermittant it seems. The little keyed retaining nut that fastens the BNC to the case has needed tightening several times during the last three weeks. Now the transmit seems to be out most of the time but if you wiggle the rubber duck it will pick up and work for a while.

Swapping the duck for the BNC on the mobile 5/8 whip, back and forth, very likely led to the premature failure on this one.

It's been a great little rig though. I hope R/S can clear up the problems I'm reading about (and mine!).

This idea was in 73 about 5 years ago - the person suggested first
using a long setscrew that went thru the brass ring into the main
part of the mount, and a second setscrew that went thru the antenna
into the ring.

It would take a drill press to do the job right, but you could do
a half dozen mounts in one batch....

de WA6ILQ - who once had 6 NMO mounts on a Volvo station wagon...
plus the auto alarm used the rear window defroster grille as a dipole...

5505. amateur/public service use?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-26 00:00:00 UTC
From: borst@tc.fluke.COM
Message-ID: <DAss09.J22@tc.fluke.COM>
Source record: 216017

There have been numerous threads on using amateur equipment outside of the alloted amateur frequencies.
I too have a legal need to have access to frequencies in both the public service area as well as the
amateur bands. I have been unwilling to break the law and 'mod' my radio to have wideband Tx/Rx.

Sometime back someone suggested getting a type accepted radio which had the capabilities of amateur frequencies,
specifically 2M. The model mentioned was a Kenwood TK-250. I proceded to get a spec sheet for the unit and while
it apparently has the ability to access the amateur 2M frequencies, it can't get the public service frequencies I
need in the VHF band.

According to the spec sheet they have two models of the VHF unit (TK-250), one which accesses 136-150Mhz (which
will also let one at the amateur 2M band) and a second model which is spec'd from 150-174Mhz. My problem is that I
need the 155.xyz Mhz as well as the amateur band.

I forgot to save the gentelmen's name that posted the article recommending the TK-250. Does any one know whether
the radio really does have two sets of hardware or can it be 'fooled' via some programming trickery to get 155 Mhz
as well as the 2M band?

Looks like a nice compact, rugged HT though!

I have had great luck with a Yaesu 747 with the remote head kit. They are probably hard to find now. The 747 is simple and has a large display and keys which is important if you operate tryly mobile and maybe in 4wd. I use a spider antenna and seven resinators (use the stainless steel marine mast and the marine band adapter with guys and straps) for an antenna. I use the SGC-230 feed point tuner for an AT. When I go into a serious outback environment I switch over to the SGC HF whip.

The new Yaesu remote head (900 or 990) is not good for hard core mobile because of the small controls and display. Not all of the controls are on the remote head.

If you want real rugged, use the SGC-2000 radio and a remote head. It is designed as a military HF radio. Expensive but it works while it is sitting in mud.

Good luck

Bill Harwood
AB6DY

P.S. I do a lot of 4wd mobile in a Ford Ranger in the Death Valley area. I live here; not driving up to play from Los Angeles.

My previous post must not have made it through. (were having trouble with the server or some provider somewhere) My question relates to transievers, I am new to radio and need some direction. I am currently building two 2600 BPS modems (using the EXAR chipset XR-2400 with XR-2443 microcontroller) These are standard telco modems, but I am adding audio in and out jacks. Can I connect these directly to audio in/out of the transiever? If I used a 9600/14.4/28.8 modem could I connect it directly? What frequency should I look for? What price should I expect to pay? I am building 2 to set up a communications link between two devices through standard serial ports. I have heard *some*thing about a TNC, is this for packet radio? With my setup will I be able to access packet radio? Ack, I am confused. Will this require an FCC license, if so where can I get a book to study for it. I need a reange of a few miles, but if price is too much I can settle for around 500ft. Are there any FCC regulations against encrypting my signal? Can I keep it up for extendad periods?

That's enough questions, I would really appreciate it if you could Email me at site@xnet.com, thanks!

5519. NMO theft deterent...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-26 00:00:00 UTC

I just put up an NMO mount antenna on my mobile. Obviously these antennas can be stolen very easily. I was thinking about drilling two small holes in the base of the antenna and threading in two small set screws to hold firmly on the mount coming out of the car roof. I think this would make unscrewing the antenna off very difficult.

```
A <- antenna whip
___A___
>|_______|< <- antenna base with '<' and '>' as set screws.
| | <- car mount's threads
------------- <- car roof
```

Does anyone have other ideas? I would like to hear them as I am sure this is a concern for many others.

Thanks!

>Try be a real ham, learn CW. Let the operators remain on VHF.

Nonsense. Would you have us forego superhet receivers and stable
transmitters too in favor of coherers and spark gaps? A very
important part of being in amateur radio is the ability to select
and apply the appropriate tools and techniques for the communications
task at hand. To deliberately use less than the best techniques
available to you can be a sign of less than good amateur practice.

I'll grant that if your means are limited to coherers and spark
gaps, use of DSP technique, or other more advanced techniques,
may be beyond your reach, but you are very wrong to attempt to
drag everyone else down to your level of competence by implying
that those attempting to use SOTA methods aren't "real" hams.
Hams have traditionally been at the very forefront of communications
technology, eager to apply the latest techniques to the tasks of
radio communications. That's one of the very basic purposes of
amateur radio, to serve as a testing ground for new ideas and
new methods.

A "real" ham would be excited by these developments and would
be trying to learn all he could about them. Of course if he is
just an *operator*, unwilling to do more than behave as a crude
simulation of a modem, then stone age methods may be all that
he can handle.

Leon
Like you, I have a 2410 in my van and really liked it, but wanted to get a remote head unit for my Mitsubishi 4wd. Being an ICOM fan, the 2700 really caught my eye at the Dallas Hamcomm last year. That's where it was introduced and I couldn't resist!!.

I appears to have more intermod than the 2410, but I don't drive the van in town much so it really isn't exposed to the same RF environment. (Some of the local pagers are located in town rather than on the mountain and are running about 1KW to a gain array..) Anyhow, I also noticed how extremely sensitive it is and so I am now using it on a 1/4 wave dual band antenna - the kind that look like a cellular antenna. It hears everything and the intermod is dramatically reduced.

Bottom line: I really love the 2700 and it's features. I use it everday going to work and like it better than the 2410 because of the features.

Hope you have good luck with whatever you buy.

PS I sent mine to ICOM to check on the intermod and Gary went thru it with a fine tooth comb. Said it was right on specs. Great ICOM service and a real feeling of confidence with the radio after they looked at it.

Hello there.
It seems that this is an appropriate group whithin which to ask for
help. So here goes.

We (a public safety agency) would like to have a mobile repeating
system in one of our vehicles that receives VHF and repeats out on
UHF and vice versa. We know that we can do this with a little
wiring and such for one channel, but we would like to be able to
do it with more than one. Do any of you know of a product or means
by which to do this? (technical stuff to follow)

It would go something like this. For multiple channels imagine
these in parallel...

Thanks!!!!

Justin

As your diagram indicates you are using Maxtrac radios, there is an easy solution.

1. If your radios are of newer vintage, the Maxtrac will have a black 16 pin accessory plug on the back of the radio. If this is the case, Motorola makes a very elegant solution called RICK. The RICK is a repeater controller that will connect the two Maxtrac's together via the accessory jack and viola....you have a full function UHF-VHF repeater. You can use your choice of channels that are programmed into the two Maxtrac's (UHF & VHF) with the appropriate warning regarding authorized use of your liscensed frequencies. With the RICK you can manually turn the repeat mode on and off so that the mobiles can be used as normal or as a repeater.

2. If your radios have the older five pin white accessory connector, you can still use a RICK, but the switching will be done via Voice Activation (VOX). This is a less optimal solution. If you have five pin radios I would recommend a Zeotron Repeaterman Controller (a bit mor copmlicated to connect) that will work similiarly to the RICK as described in Item 1, but also
allows for two P.L.'s, Courtesy Tones and DTMF changeable P.L.

Both solutions should cost less than $ 500.00 if you include labor to install. I can refer you to a source to purchase if you are interested.

Hope this helps.

I've been using one for over a year, mobile and occasionally base.

One thing I've noticed is the audio quality, whenever I go to any of my friends shacks and listen to a variety of rigs, none seem to compare with the 555. The variable width IF filter is great, both for SSB and CW, not as sharp as a set frequency, but more pleasant to listen to.

If you like CW, this is a great little rig with full QSK, and built in keyer. It does drift a little, but haven't had any complaints, always get excellent reports on QSO's on the audio. The noise blanker works well, and is required for mobile use.

I only use 2 bands, 40 and 30, so the modules aren't a problem, I have to change resonators on the antenna anyway.

I have some complaints with the way the system is layed out. The speaker jack is on the front panel, and the CW jack is on the back. The speaker jack is a 1/4" phone plug, and the CW jack is miniture stereo.

It is very simple and doesn't have any extra buttons to be pushed or cause distraction while using mobile. It is tuned with variable inductance and has no extra receiver noise from PLL, I can often hear stations clear when the other stations are complaining about not being able to dig the signal out of the noise.

It is only 50 watts, but seem to be adequate. You can't jump around, it tunes like a mechanical radio (it is), so to go from one end of the dial to another is a lot of cranking, with only 60KHz bandwith on my antenna, not a problem.

It is simple, probably not as cheap as it appears if you want to run it on all bands, but over a 40,000 miles of vibration in 16 months, and not a hicup.

It is a TEN-TEC, if that means something to you, it does to me, I've opened it up, and it looks very solid, I was going to move the offensive connectors, but decided I could live with them, but it could be done.

It fits perfectly where the ash tray was in my Sable Wagon.

Not for everyone, but I am pleased with it.

The FT-102 was a very fine rig with some very odd quirks. There were dozens of DIP relays in it, most of which became resistive over time. Replacing them every few years was great sport. It also had three final tubes; the manual went on and on about how the odd number of tubes helped greatly in transmitter purity. I enjoyed my -102 for many years, before finally upgrading to an all solid state rig.

>gell cells from full charge to deep discharge helps.

I'll have to disagree with this. The best way to maintain a gell-cell is to keep it on float charge, at 13.6 to 13.8 V depending on the temperature, and discharge it only as much as necessary for the use that it is in. Yuasa literature indicates that about 200 cycles of deep discharge can be expected, versus thousands of cycles of light discharge. Sulfation occurs primarily while the battery is in a discharged state, and can be minimized by keeping the charge level high, which is perfected by constant float charging. Assuming the battery is not abused by excessive discharging, undercharging, overcharging, or storage at high temperatures, the primary factor determining its useful life is time since manufacture, as Dick correctly states.

>They have a life
>of about 2-3 years whether or not they are used. I used to sell them
>and business is good for emergency stand-by lighting.

Replacement at 2-3 year intervals is a good plan for critical commercial applications like emergency lighting. Amateur applications may get 4-6 years, however after that long the AH capacity may be only half of that of a new battery.

>
> The main thing that kills gell cells is sulphating. A chemical
>coating forms preventing charging. Cycling helps retard
>sulphating.

Occasional moderate cycling might help reduce any stagnation of the chemicals that could happen with constant float charging. But deep discharging will accelerate sulfation. Experience with car batteries should tell you that. One or two discharges below 10.0 V for a 12V battery can ruin it. Systems that run unattended on gell-cell batteries should be designed to shut down all current flow from the battery once the voltage drops to 10.5 V, until it is recharged. Recharge must be as soon as possible, as sulfation is accelerated

while the battery sits around discharged. If recharge is likely to be delayed more than a couple of days, consider terminating the discharge sooner so the cycle is not so deep. Batteries being stored unused should be fully charged before storage, and recharged every 6 months. High temperatures (> 100 F) are very bad for lead-acid batteries as well.

>
> If you're going to buy used gell cells you might want to get
>familiar with the mfg's date codes.

Many are coded simply with a 6-digit number of year/date/month in that or some other order. Others are much more obscure. Assuming you can decypher the date, don't buy any that are older than a couple of years unless the price is low enough to justify the reduced capacity that you'll probably have.

Another vital step in buying used gell cells is to carry a voltmeter and measure the voltage of each one before buying it. Definitely don't buy any with less than 12.4 V (or 6.2 V for a 6 V unit, etc). They almost certainly have sulfated and won't charge back up. Of course, if they have been charged recently, they may still be in bad condition and pass this test.

Considering the somewhat fickle nature of gell-cells, it is easy to see why NiCds are still preferred for many applications, especially those involving deep discharging, storage in a discharged state, or rapid recharging. But once the capacity required exceeds a few AH, the gell cell has a clear cost advantage.

No can do with the newer 530's. It's a hardware thing. There is a
very tiny board that components were left off of thereby disabling the
800 & 900 MHz bands...I understand Yaesu sent the boards to
Canada.

I have an NMO antenna and haven't had it stolen yet, but I'm sure that day will come. (Replacements are readily available from any unattended police car.) I like that it is easily removeable so I can switch to another band or antenna without needing another mount. I would agree with Jerry that it may be better to just let the kids have the thing than to encourage them to use a lot of force and damage the rest of the car. For what it's worth, here are my thoughts on preventing theft:

Set screws: Already described. It seems that it would be necessary to anchor the brass nut to the center part of the mount as well as locking the antenna to the brass nut. They may reduce the watertight integrity of the installation, or rust up and become impossible to remove later.

Really tight: The phone company uses a strap wrench to tighten the caps on the receivers of pay phones so they can't be unscrewed by hand. Perhaps that could be done with the antenna as well. Or maybe it will break the threaded ring out of the antenna base on some models.

Removal: Since the antenna can be removed in seconds, just remove it after parking in a theft-prone area, and store it in the trunk or take it with you. Putting a blank NMO cover on the exposed mount could suggest that the antenna has been gone a long time; no need to break into the car looking for it. Not very practical if you are always parking in theft-prone areas.

This is a common problem on all HT's. Pressing *down* on the ring of the BNC
connector while turning it to attach or remove it seems to help prevent
twisting the connector in the HT too much, as well as reducing wear on the
bayonet lugs on the socket. Also, it is generally not necessary to twist the
ring all the way to the stop to get a good connection, that is just to keep
the connector from pulling loose. If you are using the unit mobile and not
pulling on the antenna cord, then it may be feasible to not fully engage the
bayonet lock to save wear on the connector.

>
>It's been a great little rig though. I hope R/S can clear up the problems
I'm
>reading about (and mine!).

One of my acquaintances has a HTX-404 which will not transmit on high power
when connected to car power with the engine running, it works OK with the
engine stopped or on low power. NiCd battery is not attached. It seems that
either the transmit power drops way down, or the signal goes off frequency.
The display appears normal. I haven't investigated further to see exactly
what is happening. Anyone else heard of this problem?

Hello,
Thanks for the opinions on the Yaesu FT102. Several of you compared the
102 with the Kenwood 830S, but not in any detail. As a new ham looking at
rigs that included WARC coverage, but not yet general RX coverage, which
were the best? Some that come to mind other than the 102, is the 830s
and the 530S, Yaesu FT101ZD MkIII, Icom 740 etc.
Thanks
Chris VE6RDC

>alignment. Anyone have any suggestions or like experiences?

Yes, that's a common phenomena with R-7000. As the reference oscillator
crystal ages, it changes frequency. There's a variable slug tuned
coil located under a shielded partition on the side of the R-7000
used to tweak the oscillator back on frequency. It's a fairly
simple adjustment. The difficult part is finding the proper coil.
Make sure you use a proper alignment tool to avoid breaking the
core.

By all means, get a service manual. The schematic shows the coil,
but the symbol for the coil is in error as it doesn't show the coil
as tunable. A schematic is furnished with the R-7000 so you should
be able to find the coil without the full service manual.

I replaced the R7000 with an R7100 and no longer have the R7000
service manual.

Mike;
I appreciate that you used the word "please". But you do seem to have read
more into my words than what I put there. The only thing I assumed was that the
original poster might appreciate hearing a variety of experiences on the topic.
I'm sure he appreciated hearing your's as well. As far as antennas go, the
biggest trouble I've seen is breakage. As far as theft goes, this I have seen
with respect to radios themselves. Along with the accompanying busted windows.
I do know of a number of people who have made their NMO antennas very permanent
with the use of assorted epoxies on the mounting threads. They hadn't been
ripped off, they just thought it prudent.

You have not listed the little known Cubic Corporation Astro 103. The filter system and audio in this unit are supurb, as is the passband tuning and the adjustable IF gain and AGC characteristics. This was the last Swan made as I understand (the dying Swan?). Since obtaining this unit several weeks ago, I have put aside my old faithful DX machine, the Kenwood TS-830S. The Astro has dual VFO's in contrast to the external VFO needed for the TS-830S and the FT-101ZD. I am not that familiar with the FT-102 except for some rumors of bad pins on the boards.

since SSB is a supressed-carrier mode, it won't put out much power if you simply key the mike. Try talking and you'll probably see that the wattmeter will indicate higher output. Don't expect to see 10W, though, as this is probably a peak rating that is probably only met for tiny intervals during your transmission.

George

I own a Kenwood TK-705 which is a mobile model of the commercial radio. The specs on it also say they have the two models; 136-150 and 150-174 mhz. I got the 150-174 mhz model and found out that it does in fact tune down into the 2 meter ham band without any modification.

My suggestion would be to talk to a technician at a place that sells them (one that really does know the radio). Ask him what the specs really are as they don't always publish the radio's full capabilities (like with ham equipment).

I still use mine (bought it in '79). Twenty watts, more or less, 80-15m + one
500KHz segment of 10m, no WARC bands. Have to open it up and reseat the
modules now and again.

Price sounds a trifle steep to me, but I'm not all that up on current used
equipment prices.

For the past three months 2-3 punk songs have been posted each and every day to alt.binaries.sounds.music. These are name brand punk bands and not a bunch of shitty generic bands in case you're wondering.

All sound files are CD-quality MPEG's.

Free MPEG software is available for: IBM PC (DOS), Sun, HP, SGI, PC running Linux, and PC or NeXT running NeXTSTEP. 386DX or better and 16-bit sound card required.

> simultaneous VHF/HF dual port operation? Any other recommendations from
> anyone??
>
> Thanks,
> 73, Bill W7LZP
> wrt@eskimo.com

Hi Bill. I tried the Hostmater II software also but didn't really like
it that much either... The Lan-Link v2.32 runs dual port quite well; it
does take a bit of "Doc" reading to figure out all the bells an whistles.
Even the install program, takes a little configuring to get it right...

Right now: I am running a PK900 with PKGold the registered version... It
is a sweet set-up, the program is really nice... Dual - split windows
for HF & Vhf, allows you to switch back an forth at the touch of a "f" key
an still watch whats going on in the background of either port... I under-
stand that there is a Kam+ version of PKGold available..? If it runs as good
as the AEA-900 version it would really be worth looking into...

There are 2 things I don't like about it... If you get it through a "Ham"
supplier, one you pay more for it <$120.++> an when you get it; you have
to call the author in Ca. for the registration install serial #... To me
thats a pain! I understand that if you get it direct; its cheaper an comes
with the reg # an manuals . The other thing I don't like about it is: If you have someone
over an
they want to use their "Call" to make a connection: you can't just use the
myc command to change it... It makes it a "1" user program period... I
understand it was done to prevent pirating the program, but both of these
things bugged me... Other than that; I really like the program an its
features, esp. the simultaneous dual porting an Gateway features...
More food for thought: I hope... De Tom KD4QHH 73.

Message-ID: <3sp2af$u3c@mail.one.net>
Source record: 216041

I have an older HW24HT dual-band HT that is the same as a Standard C500. Standard never sold the C500 in the US except under the Heath name. This is the older HW24HT, there is a later version that has mods published on it but I've never seen a mod published for this one. I know one is available because there was a MARS mod available from Heath if you could show proof you were a MARS member. Also the guy that goes around to hamfests and does mods will modify it for $85.

I want to save my money and do it myself. Does anyone have the details on the MARS mod for this unit?

Source record: 216043

rpmackin@ashley.business.uwo.ca (Robert Patrick MacKinnon) wrote:
.....
> Are there any special charging considerations that differ from
> NiCd or lead acid cells ?
>

Usually no, they can't be revived. Two things can happen to a
GEL-CELL that will kill it. One is sulfating, this is a copper sulfate
and calcium sulfate coating that builds up on the plates. The other
thing that happens is that a very thin coating of "distilled" water builds
up on the positive plates. Either this or sulfating insulates the
positive plates and therefor no current flows. You can prevent
sulfating not discharging them all the way down. You should
not allow a GEL-CELL discharge below about 1.7 volts per cell
or about 10 volts in a 12 volt pack or 5 volts in a 6 volt pack.
Also, never let a GEL-CELL discharge by sitting. This is one
sure way to kill both GEL-CELLS and regular lead-acid batteries.
When this happens the thin layer of pure water builds up and
insulates the plates. The best thing that you can do for your
GEL-CELLS is keep them on a GEL-CELL charger when
they are not being used. A proper GEL-CELL charger will
keep them charged and allow slow cycling. They will charge
the cells to full charge and then let them discharge slightly
and then recharge them over and over. This is the way that
most standby lighting systems work.
If you have a GEL-CELL that has died from sitting you can
try this ****CAREFULLY!!!!!!!****
Hook up your LOW CURRENT (<.5 amps) charger up
backwards to a DEAD (0.0000 volts battery) and watch until
current just begins to flow. Monitor the current carefully!
If the current doesn't begin to flow within about three or four
seconds or if the current rises higher than about 10ma stop.
If the initial current is greater than about 10ma STOP.
Then hook it up right and see what happens.
This will stir up the electrolyte a little.

<snip>

My old ICOM 2AT didn't have this problem with the BNC ... but your comments are certainly worth noting. I had thought that I might keep a short cable on the HT while using it mobile so that I could break the connection at a point other than the BNC on the radio itself.

The HXT202 is on it's way to the R/S repair center now. They said to expect it back in about 15 days. Bummer.

|> comply with whatever is necessary, - Steve -

While travelling up the Owens valley (prime hang-gliding area) I have often heard pilots (or however you refer to those who hang-glide) communicating on 2m simplex.

This seems to work well for them, but it causes a problem for me as they were not using call signs and were pretty obviously unlicensed.

Apparently someone has "given them a clue" as some are now licensed.

There are some extremely small (shirt pocket sized) 2m ham radios that easily meet your needs. They will cost you in the high 300 dollar region with the commonly-purchased accessories you will probably want. If you want cheaper, you can get down to $200 or so, but the size and weight go up to "carry on belt" rather than "shirt pocket" size.

Naturally, you will have to pass the no-code technician-level exam, which shouldn't be too much of a problem for someone who has mastered the hobbies you have!

More questions? just ask!

George

Source record: 215903

I would like to know more about HF transciever Power Amplifier (PA) stages. I have an Icom 701 transceiver with blown finals. This occured while I was searching for a match using a manual antenna tuner.
When I got into ham radio, 6146B's cost $6.00 each. The Heath SB 101 was the poor man's Collins, HRO-500s were $1500!
Blown xistor finals are between $50 and $150.00 the matched pair. Ouch! I have no problem installing them, except the PC board traces usually will only stand up to a couple of R/R cycles. My first rig was a Knight-Kit T-150, with reduced power to 75 watts, and using a 7.192 kc Xtal (rather than the VFO) to stay legal as a novice.
I am interested in knowing the mechanism of failure of PAs in modern, and not so modern Ham radio solid state HF radios. It seems that the very modern rigs use more sopisticated protection schemes to make the finals more "bulletproof". I think there are two mechanisms: Excessive heat, due to improper loads, and, apparently, high emitter to base voltages resulting from high SWRs. I would guess that, if the latter were the case, then failure would be near instantaneous, with the first encounter with an open, or shorted coax---- but I don't know....
How do modern solid state PAs deal with these problems?

A few questions:

1. If high emiter to base voltages are the fault, but don't immediately cause failure, is the failure mode cumulative? That is, might it take a certain number of open (antenna) circuit, or other high SWR condition "hits", each progressively damaging the finals, until eventual failure?

2. Will reduced power tuneups using carrier level adjustments, while bringing antenna tuners into matched conditions, help in saving finals from failure?

3. Why do the newest rigs seem to tolerate abuse more than older (e.g. Icom 701) rigs?

4. Any retrofit circuits out there to help protect the
older solid state PAs? Perhaps a simple SWR bridge
Reflected power sample voltage to control something
in the PA to fold back, or cut off the PA.

5. I heard somewhere that there is a better retrofit Final
transistor for the Icom 701, more rugged, but
requiring minor circuit changes.. anyone out there
know?

5603. Icom V21AT, W21AT, X21AT ext receive

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-28 00:00:00 UTC
From: dgbart@primenet.com
Message-ID: <3ss5rf$ffk@nnrp3.primenet.com>
Source record: 215905

This might be old ground I'm covering, but someone asked about it here a couple of weeks ago.

The Icom W21AT dualband HT can be given an extended receive range (50-999 MHz) by doing the following: turn radio off; hold down # and B keys, then turn radio on; wait for the display to cycle through a self test and for the radio to beep, then release the buttons.

The instructions mentioned that there should now be a new RP function in the SET lineup, which allows the W21AT to access these frequencies. I do not have a W21AT to verify this.

But I did verify it with a V21AT and an X21AT. It works on both, to varying extent. The V21AT unlocks the 220 side for 215-230 MHz receive; no change to the 2M side (it still covers 136-174 MHz normally though).

The X21AT unlocks very nicely, allowing you to tune 50-1310 MHz, continuous coverage! The 2M portion covers 50-300, the 440 portion covers 300-1000, and the 1.2 portion covers 1000-1310 MHz.

To access these frequencies, at least how it's done on the V21AT and X21AT, use the [f] DSEL function to select MHz/KHz etc. There is no extra "RP" function in set, at least not on these models.

Thought this would be of interest.

>how to tune freqs below 136 MHz...Does this radio receive below
>136 MHz, or is it just a figment of his imagination?...If it does
>receive aircraft, can anyone tell me what buttons to push...

>>ttfn fiz KB0PRE

No figment, heres what you do.....

Hold down the "f" key for about one second.
press the "low" key. This will drop you down to 118 and allow
listening all the way back up to 136.

There is also a mod you can do to open the uper freqs to just above 500
Mhz. Then theres another mod to transmit on 136 to 175 or so. Kind of
usefull for emergeny use only.

This is a great radio, if you cant get a manual let me know and Ill copy
mine for you. Without it you will get nowhere fast!

I'm experiencing something like this with a 5100 mobile, plugged into the cig socket. It appears that on high power with the engine running several repeaters will not come up. I've been told from a signal report that theres a whine in the background. I'm guessing that either the power is dropping, or more likely that the engine interference is somehow affecting the PL when on high power? I haven't investigated much yet but will be doing so (firstly with a power/swr meter).

>My address : bobba@nqueeg.ICO.OLIVETTI.COM

I have a HF 150 in my coral of radios. I think it is a good performer. It is very small and simple to operate. If you you an outboard speaker like the Grove SP 200, it can sound quite nice. I installed the backlight kit, which makes the radio usuable in a dark room. The mail order house said it was "simple to install" (NOT). I would also advise the outboard keypad, which makes life much easier. I have found the sync det akward to use. It requires very fine tuning. Others have like the "fidelity" option, but frankly, I can't get it to work with a darn.

For day to day listening, I actually like my AOR 3030 better.

Hope this helps,
Mike Kuna

I'd say that communicating while skydiving would constitute "learn and experiment
with radio communications".

|> And to provide skilled operators
|> and technical specialists for time of emergency.

Someone who could communicate while going 100 MPH straight down would be a good
person to have around in an emergency, IMHO!

|> I have had several people ask me about ham radio and show an initial interest
|> simply because they think its alternative to cellular phones. Its not an
|> alternative to anything.

A lot of people have come into Ham Radio for what you would consider to be
the "wrong" reasons. This doesn't make them any less valuable than the

"techies". They, and their equipment, are still there in an emergency. Often they find other parts of the radio hobby attractive that they hadn't even considered before getting their ticket.

|> Your application might best be served by Private Land Mobile Radio. You can

|> operation under Part 90 (PLMR) or part 95 (GMR).

Unless, of course, the radios have to be modified for use in a hands-free, high noise environment. You can't do that with type-accepted equipment! Also, a typical ham HT will have features that might be useful to our para-gliding friend that cannot be found on Land Mobile rigs. Land Mobile rigs are also quite a bit larger/heavier than many ham HTs, which is a prime consideration here.

|> Why bother doing all the studying and preparation for an exam when you can
|> send $100 to the FCC and get on the air with pretty cheap, type accepted gear
|> - that anyone you choose to designate may operate (anyone operating a ham
|> radio needs to be licnesed operator - anyone you choose can operate your
|> licensed PLMR station).

Can't argue with you here, except that $100 is pretty steep for a glorified CB license!

|> If you want to go through the exam process to become a ham beacuse you are
|> interested in the study and use of radio communications, by all means do it.
|> You will probably find it a rewarding hobby.

Heck, do it for whatever reason. The worst thing that can happen is that you will learn something! :-)

|> Like I said - this isn't a flame. You asked for opinions/recommendations and
|> I am giving you mine. I am glad you asked this group. But beware of bad
|> advise from many hams that make Amateur radio out to be all you will ever
|> really need. I still have a cellular phone.

I don't. I don't use autopatches either. Seems all my friends are hams...

From: jdonimi@nv2.uswnvg.com
Message-ID: <3ssdcq$911@fred.uswnvg.com>
Source record: 215912

If you've purchased a Kenwood YK-88 crystal filter recently, you noticed it's the same filter as always but now it comes soldered to a daughter board. If you installed that crystal filter in an older rig (TS-940, TS-440) you had to remove the filter from the daughterboard before you soldered it into your rig.

I want that daughter board and will pay $10 for one and I will pay the postage besides.

Contact me at jdonimi@uswnvg.com or call me at (206) 450-8395.

experience, i send a 1750hz or i talk strongly in the mike
the problem doesn't appeear with my gp6 antenna which has a tos about 1, with this antenna
the level ouptut is 10w in fm AND SSB
but when i connect a 1/4 wave antenna or a 2x11 elemnts antenna (tos about 1.4)
the power in SSB is only 1w (depndibg of the frequency so od the tos (1.4 to 1.5). the
ouput level seen on my meter (relative ouput level) move very weakly
when i send a 1750 tone or when i speak very strongly in the mike. but no problem in fm
mode (still 10w)
i hope that this information are no clear, and that someone could help me

Garmin sells a PC package that does quite elaborate plotting. IT also lets
you store and change waypoints, tracks, and everything else normally
stored or edited in the unit. There is also a shareware package called
APRS that lets you plot GPS positions transmitted via packet radio. It's
available from all the usual ham radio download sites.

Source record: 215935

Jon Goguen (acl@ultranet.com) wrote:
: I need a female APC-7 cable connector, or (ideally) an APC-7 female to N
: male adapter. Can anyone suggesta source?

Jon,
The cheapest source I've found for APC-7 adapters is:

Inmet Corporation
300 Dino Drive
Ann Arbor, Michigan 48103
(313) 426-5553 (voice)
(313) 426-5557 (FAX)

Their distributor is:

Sertek, Inc.
3481 Old Conejo Road
Newbury Park, California 91320
(800) 334-7127
(805) 375-6680 (voice)
(805) 375-6696

The part that you are looking for is Inmet #5112 (APC-7 to
N male). They are going to cost you around $85 apiece, and that's
cheap!
The APC-7 (and APC-3.5) are precision, sexless connectors.
That is to say, there is no male or female. They are very rarely
used in industry, except for test equipment, and then pretty much
limited to Hewlett-Packard. I recently purchased a few APC-7 to
N-female adapters for my newtork analyzer (HP8409), and they were
$85.50 each. I lucked out last year a bought the remaining stock
of APC-7 to SMA male and female for $35 each (about 4 of each) from
Lucas Weinschel and was damned lucky to have stumbled upon that deal.
If you don't need the coupling shell on the APC-7, Inmet has
a line of lower cost adapters that you might consider (they're only
$60 or so). This connector with the N-male is #5120.
If you get any, take <VERY> good care of them!

I've used the 2036 for about 18 years. The original only covered 146-148MHz
but mine covered from just under 145 to 148. Output is about 15 watts and it
draws about 3 amps. I picked up an older under-rated matching Heath PS and it
works fine. I use on the DX Packet Cluster full time now. Good rig and once
you have the manual, easy to tweek. I can't remember what the adjustment hole
is for, but could look it up if I can find the book.

Hope you enjoy. de Ted/AC4CS
==========holman@computek.net, 6/27/95==========
I just picked up an old 2036 and would like to know a little about it
1. what's it rated at powerwise
2. what should it draw current wise
3. what is the adjustment (hole) on the back panel

Although it seems to work fine, I would like to peak it up a bit.
Until i come up with a book the above info will really be appreciated.
If you have the old book that would be great too

Please post or e-mail direct . . . thanks in advance

>Your are right Gary, I must have been in a bad mode the day wrote that stuff...
>
>But I still think decoding CW by the ear beats the PK-232, that was the original
>question.

That's true. The PK-232 isn't very good at copying Morse, heck it isn't that good at copying incoherent FSK, and doesn't do the coherent modulations at all. If we restrict ourselves to what's offered commercially to amateurs, there aren't any machines as good as (exceptional) human operators. But those are rare, and fortunately as amateurs we don't have to accept AEA or MFJ or Kantronics' solutions, we can build. There are coherent designs going back as far as the 1960s that will outperform the PK-232, or a human operator, for coherent modulations. Convincing amateurs, conditioned to believe OOK Morse is the ultimate weak signal method, that this is true, however, is a real uphill battle.

OOK Morse decoding is at best a tie between man and machine though. That's because the modulation itself is the limiting factor in weak signal work. There's little an operator or a machine can do with OOK Morse when signal levels get down to where the coherent modulations start to come into their own.

There's a worst case advantage of 6 dB for coherent versus non-coherent modulations (and more on the order of 33 dB under most circumstances). Nothing a Morse operator (or a Morse machine) can do can make up that handicap. You can't copy what you can't hear, but a good coherent machine detector can pull coherent signals out of the noise floor by using signal correlation and coding gain tricks that just don't work for OOK Morse.

The heck of it is, none of this is rocket science. It's all rather straight forward and inexpensive today. If we could just change the mindset of operators, we could have these systems in widespread use, with all the attendant advantages of requiring lower power and more modest antennas that the performance gain implies. I'm afraid we'll have to wait for the Japanese to build them into the radios before this happens, though. Amateurs seem to have lost the spark needed to keep up with communications technology. They're content to be merely operators, pushing inferior wetware decoding to its ultimate limits instead of being smart and adopting even modestly better encoding methods and hardware.

In that regard at least, you were spot on. Today's amateurs seem more willing to work hard rather than to work smart. That's ultimately a losing game, however, as the rest of the communications world passes us by. I call it a "spark forever" mentality, though that wins me

few friends.

>How do you compare the IC-735 against the FT-757GXII? What options make
>either radio a standout?

Both are good radios. What makes the IC-735 stand out are the excellent
receiver, the exceptionally well designed transmitter thermal system,
the transverter jacks (a personal requirement), the intuitive control
interface, and the very long track record of proven service. (The IC-735
had the longest production run of any modern HF radio. It obviously met
the needs of a lot of amateurs over the years, and still does.) There are
only a couple of larger and much more expensive current production radios
that I would consider superior to my IC-735, and those not by enough to
make me want to trade.

>Thanks
>

The UT-50 is a Tone Encoder and Decoder. The UT-51 is a Encoder Only and
was installed as a standard radio in alot of stores.

Most new ICOM radios install encode only units, with the encode/decode as
a option.

You are certainly not asking dumb questions. I, myself, am glad you did.

I would not recommend Amateur radio for the needs you have described for one simple reason: It is not what the Amateur Servcie is intended for.

This is not a flame. If you want to become a ham, please do. But please do it for the right reasons. Ham radio exists to provide people a place to learn and experiment with radio communications. And to provide skilled operators and technical specialists for time of emergency. Please see the first section of part 97. It is not intended to be a replacement for other services that would be more appropriate for certain needs. Don't get me wrong - you can use ham radio for the purposes you mention but if that's all you need radios for, please reconsider.

I have had several people ask me about ham radio and show an initial interest simply because they think its alternative to cellular phones. Its not an alternative to anything.

Your application might best be served by Private Land Mobile Radio. You can purchase equipment that will operate on a shared basis with other users on interant frequencies. Or possibly the General Mobile Radio Service - but not likely considering how it is administered now. These types of services just require you to "purchase" a license that makes you responible for proper operation under Part 90 (PLMR) or part 95 (GMR).

Why bother doing all the studying and preparation for an exam when you can send $100 to the FCC and get on the air with pretty cheap, type accepted gear - that anyone you choose to designate may operate (anyone operating a ham radio needs to be licnesed operator - anyone you choose can operate your licensed PLMR station).

If you want to go through the exam process to become a ham beacuse you are interested in the study and use of radio communications, by all means do it.

You will probably find it a rewarding hobby.

Talk to local radio dealer about basic private two way radio. Look in the yellow pages under Radio - Two Way, etc. for Motorola Radius, Icom, Vertex/Yaesu, Bendix King, or GE dealers (there are more but you get the idea).

Like I said - this isn't a flame. You asked for opinions/recommendations and I am giving you mine. I am glad you asked this group. But beware of bad advise from many hams that make Amateur radio out to be all you will ever really need. I still have a cellular phone.

Take care.

5650. re: 6 m AM rig, Does anyone use them?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-29 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <a02_9506292147@mba.mba.org>
Source record: 215851

russeles@aol.com (RusselES) seems to have been offered a 6m
AM rig for almost nothing, and is wondering if anyone uses
AM on six anymore, that would justify getting the rig.

I haven't had the ability to listen on six meters for years, so
I don't know the current state.

Nearly twenty years ago, converting CB sets, which were am, to
10 meters caught on. It had been done before, but there was a
time when CB sets were especially cheap, and there seemed to be
a rush to do it. At the time, SSB had become the dominant voice
mode, so in some ways AM on 10m was a return to the past. On
the other hand, 10m is wide, the needed conversion required people
to do some technical work, and perhaps the novelty of it all
encouraged people to use 10m when they might not have considered
it otherwise.

The same could be said for 6M. I don't know who uses AM there now,
but there sure were plenty of AM rigs manufactured for the band in
the past. I'm sure they haven't all been scrapped; quite a few
must be sitting around doing nothing.

So maybe instead of asking if there is AM activity on 6m, it would
be better to grab that rig you've been offered (you did say it was
almost free), put it on the air and give it a try. Maybe doing so
would get people to bring their AM rigs back to the band. You could
always start a "bring back AM to 6M" campaign". It just might work.

ANother possibility is to use the rig on FM. A long time ago, there'd
be articles about converting military surplus, and when it was an FM
rig, the details were shown on converting it to AM. Then, twenty-five
years or so ago, when FM started becoming big in the form of channelized
operation and repeaters, there were articles about converting AM rigs
to FM. The articles are still out there. It's not all that difficult,
and the mods are like an addition, rather than chopping out the AM
capability. You might check locally to see if anyone is using 6M FM.

Of course, the real question brought up by your post is what kind of
rig is it? I don't think there ever was a generic 6M AM rig, so
naming the rig that you've been offered might attract more attention,
if only from people nostalgic for their old 6M gear.

5655. Does anyone from MFJ read this newsgroup?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-29 00:00:00 UTC
From: "Anthony R. Gold" <tgold@microvst.demon.co.uk>
Message-ID: <804453894snz@microvst.demon.co.uk>
Source record: 215856

I bought an MFJ-493 Super Menu Driven Memory Keyer around September 1993. It was delivered with the firmware bug ridden and incomplete. 21 months later I am still wating for working firmware.

I have recently faxed to Steve KB5TVW and also emailed to both Steve and to Stan AA5XO. But I after making some sort of vague contact I still don't have either firmware or even a promise of it. The best progress that I have made so far is to find out that there is a version 1.13 of this firmware, because someone at MFJ took a fax that I had sent to them and hand wrote that information onto the fax and then snail mailed my own fax back to me unsigned and with no firmware. Very weird!

If anyone else who works there reads this group can put in a word for me, I'd appreciate any help. Since I live many thousands of miles from (800) phone access, my economical choices are somewhat limited.

The firm boasts an email address with a Compuserve account number, but I guess they never figured or were never told that a necessary further step was to assign someone to read and answer mail that gets sent there!

After first dealing with this firm I formed the preliminary view that the firm made very poor quality equipment but got away with it, and kept their customers happy enough, through offering good warranty and customer support. I have now changed my mind on the second half of that view.

Thanks for your helpful reply. $85 is about $100 cheaper than HP! I'm
surprised to learn that APC-7s are sexless. Mine are on a Pacific
Measurements Log RF power meter. The connecter on the probe, which I
believe to be an APC-7, mates with a connector on the chassis (the
calibration output) that superficially resembles a female chassis mount
N. Are they trying to fool me?

5666. re: IC735 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-29 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <3stkt5$gkr@tilde.csc.ti.com>
Source record: 215941

I remember seeing a QST article or something similar that listed one
mod for the IC-735 as follows:

The CW keyer speed currently is configured as a tiny slide up/down lever
behind the little grey-smoke colored window. This is very inconvenient
for a mobile cw op since the speed control is not completely linear.

And, the squelch control is behind the volume pot (same shaft) which
just so happens to be of the same value as the cw speed "slide pot"

So, the mod describes how to make the CW speed control become the
"squelch" and the squelch control become the "cw speed". It sounded
nifty to me. I did a similar mod my Yaesu FT-890 with super results.
Now I can easily adjust the CW speed linearly and from the front panel
right next to the volume.

Had one for a while...mobile CW QRP...I remember selling mine for about
200 bucks. The 10 meter crystal was a bit off freq, so the dial didnt
match the operating frequency. All other bands were "fine business".
My only complaint was that the noise blanker didnt fix the ignition
noise in the Honda Civic, so I always had an S2 noise level. There was
also an FT-7B, which had an "attachable" power amplifier whose output
was between 75 and 125 watts out (dont remember, frankly). Also, the 7B
had the capability of an outboard digital display instead of analog.
325 would be fair for a 7B with the amp and digi display, but a bit
steep for the FT-7.

Repost:

I am interested in obtaining the Alinco DX-70 HF mods as follow:
a. General Coverage TX (1.8 thru 30 Mhz)
b. Extended RX or TX for the six meter band (currently 50-54 only)

I had the rig all opened last night and the boards use lotsa them tiny surface mount devices. Most pots and variable resistors are labled, though, making mic-gain, sidetone, s/rf meter, power, adjustments relatively streight forward. Did NOT see the infamous "green loop of wire" or "yellow loop of wire" labled clip here for extended tx.
Any ideas?

If your talking about a Yaesu 5100 mobile, running it from a cigarette
lighter socket is a REAL bad idea. You need to use the supplied cables
connected directly to the cars battery. The 5100 needs about 12 Amps when
running 50 watts. I'm supprised that you have not blown the fuse or
melted the wires to you lighter. The original cable also is fused on both
sides, pos and neg. The problem your having (my guess) is the voltage
drop across the thin wiring to the lighter socket, thus causing the wires
to get hot and producing less voltage to the radio when your at 50 watts.
You may also not be getting a good ground. The lighter is most likely
gounded under the dash.

You'll be doing yourself (car and radio) a big favor by using the Yaesu
power cord and connecting the radio to the battery directly. Both
performance wise and safety wise.

Ken (5100 owner)

Source record: 215949

I had the opportunity to put the Scout (555) through it's paces during Field Day. It outperformed the TS-50! Nearby transmitters clobbered the TS-50 but didn't phase the Scout. Plus, bandswitching with the Scout was actually faster than with the TS-50.

The 555 used during field day had a modification (recent QST) to fix the high-speed cw frequency drift problems. We worked at 45 wpm on the same frequency for over 6 hours.

I rate this transceiver very high. It's the first Ten Tec I've ever used and I fell in love with it.

I figured the mod out myself, but I'm not sure what I did.

On the display PCB, there are two pairs of unsoldered holes. I
stuck jumpers in the holes and power cycled the radio, and it
opened the transmitter up to 140-150MHz. The jumpers are temporary,
don't solder them in. Only one jumper may be necessary, I wasn't
very scientific. I do know my IC-2000H now transmits from 140-150MHz.

5676. Good service report for AEA

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-30 00:00:00 UTC
From: Perens@Hams.com
Message-ID: <3t1v88$4gc@hustle.rahul.net>
Source record: 215802

I have an AEA Isoloop 10-30, serial number 2382, which had a mechanical failure of its plastic shell after being mast-mounted for two years and going through some wind storms. I contacted AEA via the "hamnet" forum on Compuserve, and they agreed to take the unit back and repair it at no charge. It was repaired and returned to me promptly. AEA replaced the outer plastic shell and "updated the unit to current production standards".

It's nice to see a manufacturer stand behind their equipment.

Date: 1995-06-30 00:00:00 UTC
From: conklic9391@cobra.uni.edu
Message-ID: <1995Jun30.180659.45647@cobra.uni.edu>
Source record: 215803

attempt number 2:

I'm still looking for any assistance with modifying the Kenwood Tm-742A for 800-1000 mhz rx. The RF hardware is all present, I have a unit that was sold/shipped/etc before the April 1994 cutoff for cell reception.

I need info on getting the brains of the radio to synthesize on 800+ and switch the second antenna line into the discriminator.

I'm very happy with the results of this with the Tm-741, but to date have not been able to do anything on the 742. Also, has anyone swept either unit for sensitivity from 800-1000? Unfortunately my generator stops at 512, and I'm too lazy so far to build a doubler...

And before you flame: no, I could care less what the cell-folks are saying. I am interested in listening to the 800 systems for coverage profiling, and monitoring our projected 902mhz experiments.

Tnx in advance,

Chuck,
Several of us here own TS-430s'.
The general concensus is that it is a very useful and full featured rig
for the money. The price you quoted seems too high to us. I paid $500 for
one with the optional fm board and a MC-50 mike in Ohio.
KC7DON picked one up through the Internet from the east coast with the fm
board and some fancy receive filters for $575.
N7RY picked one up here in Oregon for $400 without the fm board or
filters.
It's only got 8 memories, which I don't see a lot of value in anyway,

(although WWV is a handy use).
If you are wanting to do remote computer control, I think you need the
next newer model. The 430 has an up/down frequency input but I don't
think that all the options you need are there.
I used the fm board the other day to work through an LA repeater, but PL
is not built in, so you are limited to non-PL machines.
I am running rtty, amtor, pactor, and clover with no problem. We ran
N7RY's hard on field day weekend without a hickup.

It's a good rig for the money if you shop wisely.

5688. FT900 Factory Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-30 00:00:00 UTC
From: "Robert Blumenkranz (Ni6r)" <radiobob@earthlink.net>
Message-ID: <3svtoa$boh@mars.earthlink.net>
Source record: 215868

I just bought a new FT900 and it has a serious Factory Problem. The radio shuts off intermittently by itself. I took it into Yaesu because they said that it needed a new micro-processor. A new micro was installed by Yaesu but the problem did not go away. It now either shuts off or the display dims and all contols fail. The radio does not respond to the Power switch when this happens. It takes some time and eventually the button will fully turn the radio off and back on again (for a while). The problem is not as frequent as it was before the new micro was installed, but it still shuts off for no apparent reason. This is a real problem since the rig is used as a remote base and it cannot easily be turned on again. Anyone have the Yaesu mod fix the problem? Did it fix the problem permentally or did the problem come back after a few weeks? Any comments would be appreciated.

> tmedin@che2.che.umn.edu
> N0UFM

Hi Tom... KD4QHH a.k.a. Tom here; the usual cause of the low pactor signal vs voice is the PK-232 audio level adjustment on rear of unit. If set too low in AFSK (thru the mic jack) the resultant output will be low. Also another point to consider is: in voice with full output available, your "S" reading would be higher an your duty cycle would be lower (50%). If set <232 & radio> by the manual <AEA> your output power would be less (50% + -> than your voice signal. They recomend <AEA> that you set your output level to about 1/2 of your regular output; due to the increased demand on the radio an power supply... Nothing may be really wrong; you did not mention any of his power output on either voice or pactor or if it works any different in HF packet. If he is running by the "books" it would look about what your saying. Pactor & Amtor run radios, power supplies & amps really hard in terms of duty cycle an requirements.
Hope this may help..?
De Tom.

> shacks for sale offers appreciated.

Hi Tom here <KD4QHH>: I would highly recomend the FT-757-Gx II. by Yaesu... I use one for mobile an HF digital at home. Coverage is: 100kc - 30MHz continueous WARC bands included, solid state and built like a brick. It comes all mode... They can usually be found abt $750. an lower depending on acc. I "DO NOT" recomend its Factory matching power supply! The radio is 100% Duty cycle rated, not the power supply though! Not even the supposed HD Yaesu power supply is 100% duty cycle. It is a small but rock solid designed radio, an I have no ties to Yaesu in any shape or form. I have abt 20+ friends using theirs <757> with little or no major complaints. I have been running mine on packet an pactor at full power out for over a year with no down time. I also use the Astron power supply <RS-35A> to run it on. That doesn't mean you can't get one that might develope some problem... But it is a tried an true preformer. There is only 2 versions of the 757 made by Yaesu; the first one had manual mode switch, an a very simple memory switch. I don't really remember all the differences; but a 757 with a manual mode switch is an early version. The later version has push button mode switch, CAT interface for computer operation and a different memory set-up. This way you can tell the difference in the ones' you might see. The earlier version goes for abt $100.00 less than the later version. Its also Yaesu's longest non changed rig they have built, to my knowledge... Hope this helps... De Tom.

If your heart is set on solid state rigs, dont forget the extra cost of a power supply. For the beginner, this can be a let down when you blow all your $ for a new HF rig and forget about the extra 100 bucks for a supply. I recommend the IC-735, The FT-757, or the Kenwood TS-440s. While lots of fine rigs are out there, these three are "tried and true" being very popular among the new hams and old timers alike. Prices should be between 650 and 850 depending on options and if it includes a power supply.

I still recommend getting a later tube rig as a start. Why you ask?
a. Cost The TS-520 , TS-820, etc should run about 400 bucks including built in pwr supply.
b. Tube finals are actually quite rugged and forgiving--if you make a mistake, you are not out mega bucks to fix the finals of the rig.

c. resale value - if you like HF, you can upgrade. If you hate HF, you can easily sell one of these rigs with little or no depreciation.

Just my humble 2 cents worth. Good luck and hope to hear you on the air sometime soon.

I want to put up a trapped wire for 80 - 10 meters. Space is a major problem. I own the house but the lot is small and the deed restrictions are large. I have no large trees to run a wire up to and the house is only about 23' tall at the peak.

The question I have is can I put the wire up with a minimum ground clearance of 15' and use it as a modified sloping inverted vee with out too many problems? I want to tie to the chimney and the top ot the garage in one direction and the chimney and a elevated swallow house pole on the other leg. This will give me about 60 degrees of seperation with the 'point' of the vee pointed upward to the east and the other two legs pointing nortwest and southwest.

Will the wire be omnidirectional in this configuration or directional? I am a neopyhte at this and really need a little help. I am studing to take the ham tests and getting my 'shack' in order for the day when the ticket finally comes in.

Thanks for the help in advance.

> Can`t be 15 hours can it??
>

Nicad batteries last longest (number of recharges) at .1C (charging at 1/10 fo
rated capacity). This is also the nominal 16 hour charge rate. This also
allows for no damage from charging longer than 16 hours. Fast charge batteries
will charge at .5C rates or slightly higher. This is roughly equivalent to a 4
hour charge time. I don't fast charge my batteries very often, unless I have a
"smart" charger that reduces the charge rate to trickle charge automatically at
the right time. Overcharging at a high rate heats up the battery and causes
electrolyte to vent -- reducing the capacity of the battery -- not to mention
chance of battery explosion at too high and too long charge rates. I use
Nicads also in my Rc model airplanes -- and can use a battery pack up to 3
years by slow charging, doing a capacity check about once a month (a capacity
checker is essential for this -- cuts off the discharge under load at 1.1 volts
per cell), and I usually charge once a week prior to flying. Battery failure
with a model is a little more devestating than the HT dropping out.

: --
: "I am Gilligan of Borg. Intelligence is irrelevant!"

The new function is pL not rP. You turn pL up to 100 to enter
all 6 digits instead of just the last 4. I believe a pL setting
of 1 is the default, allowing 4-digit entry. I would also assume
that a pL setting of 10 allows entry of 5 digits. This is not
described very well in the mod. The rP "on" setting puts the radio
into the automatic power save mode where the radio gauges how much
output power to use based on the input signal power.

Also note that my newer W21AT does not receive 900 MHz, but my
friend's older revision does.

Hope this helps.

I believe that another FT-900 owner reported that this problem was the fault of the face plate latch being loose and Yaesu promptly repaired it.

> mistake, you are not out mega bucks to fix the finals of the rig.

I agree...the "hybrid" radios (tube finals, the rest solid state) are
readily available, work well, and -- as the previous poster noted - are
really not all that tricky to tune and operate.

In addition to the Kenwoods, don't forget the venerable Yaesu FT101 series.
Also FB rigs. I have an FT101E and it works very well for all kinds
of HF operations, although I personally prefer CW.

As these rigs are 20+ years old, you may need to count on some minor
repairs, adjustments, etc. due to deterioration of capacitors, relays,
etc...I sent mine to Yaesu a few months ago for an "overhaul" and it
only cost $150 - now it's like new.

5709. Need Radiomarine Service Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-06-30 00:00:00 UTC
From: rdkeys@unity.ncsu.edu
Message-ID: <3t16de$dg3@taco.cc.ncsu.edu>
Source record: 215889

Fellow Hams and Radio Buffs:

I have recently obtained an RCA Radiomarine Model CRM-R1A Radio Receiver.
It appears to have been a 1960's manufacture rack-mount shipboard
radio receiver using mini vacuum tubes like the 12BA6, 6BJ6, etc., in a
series string to ships 115vac/dc. It covers the frequency range of
2-32 mhz, in four bands, and has 20 pushbutton crystal frequency positions
as for presets to the standard marine calling/working frequencies.
I would like to repair this unit and install it in my radio room
for the landlubber's watch of the latest from WLO/WCC/WNU/VCS/etc.

I am looking for:

1. A manual or a copy of one, or at least a schematic for the radio,
so that I can repair/restore it to operating condition.

2. Any spare parts for the radio (particularly a FL-101) filter that
is missing from inside. Also there is a somewhat odd 19X8 tube
missing that I need to find a spare of. A replacement dial plate
and replacement pushbutton frequency switch knob would also be
nice to find.

3. Any first-hand knowledge from seagoing radio operators who may have
used this particular equipment, especially as to how it was used,
what associated equipment was used with it (it has selcal and fax
positions, so it may have been used in NBDP/RTTY installations).

4. Any pointers to service shops in major ports or service personnel
therefrom who may have any information or experiences or spare parts
for this radio receiver. My guess is that there should still be
a few such service shops in places like Mobile, Houston, Charleston,
or such that might still remember or have firsthand knowledge of
this unit (and maybe some spares or a manual).

Maybe because Vincent is a bit paranoid :). When I see a posting in a language I don't understand I just skip it, the same as with radio communications (specially in HF). Dorr is write, there is nothing on USENET that makes postings in a foreign language improper, besides isn't the internet global?

> tom medin
> N0UFM

The solution is probably in the level of the AFSK tones being applied to the mike jack. I run a TS440 with a PK-900. Make sure he adjusts the MIC Gain control so that the AFSK tones drive the ALC meter a little, but not more than half scale (there's a visual band on the meter that shows this). This will drive the rig to 100 watts output, which, by the way, can be done for a long period of time. Kenwood rates this rig at full power output continuously for at least an hour (as might be the case with a VERY long-winded rtty qso). the internal fan keeps the heat sinked finals from getting overly hot. I use my 440 ONLY on the digital modes and love it! Your friend should also.

Feel free to EMail me directly if you think it would be useful.

Dave Stinson AB5S/7
72227.1640@compuserve.com
davidst1@aol.com

I am a collector, preserver and restorer of World War II aircraft radios.
I am not a dealer and do not resell overseas. I am currently working
on restoration of three complete Command Set radio systems and will
pay cash for the listed items. I am always interested in *unmodified*
BC-696, BC-4xx and ARC-5 series receivers and transmitters,
their accessories and any "odd" or high frequency units.

AN/ARC-5 Navy set needs:
R-23 receiver (190-550 KC); 3 antenna posts only.
R-24 receiver (.5-1.5 MC); prefer 3 antenna posts.
T-15 500KC to 800KC transmitter, any condition.
T-16 800 KC to 1300 KC transmitter, any condition.
C-29 transmitter control box.
(3) MX-21 receiver remote adaptors.
MT-68 single transmitter shock mount.
MT-71 two transmitter rack.
MT-70 two transmitter shock mount.
MT-76 modulator shock mount.
MT-64 three receiver shock mount.
MT-77 Antenna relay shock mount.

SCR-274N Army natural aluminium finish set needs:
A-61-A dummy antenna.
DM-33 dynamotor.
FT-221 three receiver shock mount.
FT-227 two transmitter shock mount.
FT-225 shock mount for 456 modulator.
FT-229 Ant. relay shock mount.
(3) MC-215 30" tuning shafts.

SCR-274N Army black wrinkle finish set needs:
BC-696 with black laquer/nickel nomenclature plate on top cover.
BC-454 with black laquer/nickel nomenclature plate on top cover.
FT-221 three receiver shock mount.
FT-227 two transmitter shock mount.
FT-225 shock mount for 456 modulator.
FT-229 Ant. relay shock mount.
(2) MC-215 30" tuning shafts.

I also need connectors for the units. These are silver with black
bakelite insides and large female pins. They are usually marked
"ARC" or "Aircraft Radio Corp", are 9000 series or PL-1xx series.

For the BC-375:
FT-151 shock mount.
PL-61 and PL-59 connectors for PE-73 dynamotor.

5721. WANTED: Address for an RF components supplier

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-01 00:00:00 UTC
From: steinr@holmes.ece.orst.edu
Message-ID: <3t4kb4$r3c@engr.orst.edu>
Source record: 215814
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I am looking for a mailing address for an RF parts/components supplier so
that I can get a catalog. Does anyone have the address for Amphenol or
any other suppliers -- or an 800 number?

Many thanks in advance!

Lewis:

What you describe will certainly not be optimum, however, it should work. There may be some directivity on some frequencies, but I wouldn't count on it. You may have to tinker with the
wire segment lengths some to maintain resonance, but that's what ham radio is all about anyway.

With the proximity to house wiring that you will have, you may experience some mutual interference to/from TV and telephone service. This may require some extra effort to overcome
or may necessitate avoiding some freqencies. You will just have to wait and see.

If it's any consolation (I'm almost ashamed to say this), I have two acres and no deed restrictions but because my interest is mainly 2M CW/SSB, my HF antenna is a trapped dual-band
20/80 meter dipole 20ft high in the middle and about 10' at the ends.

With 100 W on 80 meters, I can work all of the US and have worked JA, VK, etc so don't dispair. Just stay out of contests :-)

Best wishes in your studies and many happy years of hamming.

Regards, Wes Stewart, N7WS

>Casey N. Brown
>

Well.. I've had a Alinco HT (DJ-160) since 1991. No problems, holding up fine. I like the radio very much. HOWEVER.... be aware that you are not buying an Yaecomwood, so odds are you aren't going to be able to pick a used speaker-mike at a ham-fest for $5, either. Alinco (while getting better) just doesn't have the market penetration yet that Icom etc.. have. All in all, an enjoyable rig, though.

Gary,
You made some excellent points that I totally agree with. I've owned my
735 for around 5 - 6 years. Use it for SSB, CW, RTTY and Pactor. It's
a great performer and has a great receiver.

Your comment about having the longest production run of any modern radio
speaks for itself. The resale cost of 735's seem to pretty high also;
that is, they don't depreciate in cost that much.

Although I'm not familiar with the FT-757, I can't make a comparison.
You can't go wrong with a 735 however.

Regards,
Peter

Eric,

I have a TR-2500 with the manual. If you do not get any
response, I can give you any info you might need. Not
a whole lot going on though ... the scan stuff might
not be obvious.

Hi, Helene!
Welcome to the world of HF! Might I suggest you consider the Yaesu 840; it's a great starter rig, with a hot receiver, all band coverage, if shift, and all the basic goodies you want at this point. You can get them new for about $850. I've also heard good things about the Kenwood 140, although it's a fairly "old" rig now.
I have an 840, and have been very happy with it.
Popular used transistorized rigs include the Kenwood 440, which seem to go for about 800-900 dollars still, or the Icom 735.
Anyways, just my 2 watts worth. Good luck, and have fun shopping!

>Gary

Gary,

I would agree with you one some points, but from a retail sales point of view the choice would have to be the Yeasu 757.

Look at it this way, Icom had a radio that had a speed adjustment pot on the front panel for all your customers to see but no keyer! It had to be purchased extra. But show your customer the FT-757 and it was still 100 watts, the cost was cheaper and the keyer was built in!! I was working part time at Radio City and we would sell 757's at least 3 to 1.

The Yeasu FT-757GXII I think for the new or average ham (if still made) would out sell anything currently available.

5753. Help with KNWD 733A Remote Head??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-01 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrDB103G.I6B@netcom.com>
Source record: 215846

I have a Kenwood 733A transceiver withe the remote mounting kit. The radio will frequenlt turn itself off because it seems like it loses it connection.

Is this a know problem with the Kenwood and their remote mounting kit?

I spent alot of money to get this radio installed and the remote head mounted, and now I find that the radio will randomly just lose power and turn itself off,` etc.

Any comments would eb appreciated.

Thanks.

5756. HF Rig wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-01 00:00:00 UTC
From: neville.denetto@oln.com
Message-ID: <1f0.5549.1740@oln.com>
Source record: 215849

I'm looking for a used HF transceiver along with related
equipment. Essential specs include:

1. Ham bands, *and* general coverage
2. Solid state construction
3. Digital readout/s
4. Computer interface
5. Memories

Options that I am looking for are:
6. Antenna tuner (internal or external)
7. Power supply (internal or external)
8. 110/220 volt operation
9. Microphone
10. Manuals/Operating Instructions
11. Any other accessories/equipment

If a direct shipment to my home address in Canada is not possible, I
am prepared to pick it up at the Pigeon River (near Duluth, Minn)
border crossing.

Please contact me either on this conference, or by voice/fax at:
807-768-1491, all day and evenings, EDST.

Thanks

Since you have a space/height problem, just put up what you can and use it. In many cases like yours, a good antenna tuner is a big asset, it may allow you to load whatever form of antenna that you can get into the air. I have found that low antennas can be somewhat directional in unpredictable ways due to the close proximity of surrounding objects. Put it up and see what you get, it will certainly be better than nothing. Later you can try moving things around to see if it might work better (or worse).

I personally use a 102 foot wire at about 25 feet strung from house to tree to tree, it is painted with black, then green. then brown paint to keep it from being obvious, and I feed it in the center with ladder line just long enough to reach the tuner in the shack. It's not the best, but it works, and the neighbors haven't called in the covenant police yet.

In case you need a directional antenna for the low HF bands, first get your antenna farm plot of ground (with no restrictions) and go from there - the rest is easy by comparison.

GL & 73,
Don W3FPR

I've owned both the Yeasu Ft-530 and Alinco DJ-580... the 580 was ok, but the
FT-530 was far superior... much longer battery life between charges with
the ft-530, many superior features with the Ft-530... I bought one of each
to compare them side by side, ended up selling the DJ-580 and bought 4 more
FT-530's for the use of my wife and kids, who all got their ham tickets this
year. Hope my comments help.

From: ah586@detroit.freenet.org
Message-ID: <3t56c7$7nf@detroit.freenet.org>
Source record: 215756

I followed the guide-lines that were avail from the
Kenwood booth at Dayton and have also got from
Internet abt the same text. I have followed the
direction's to the letter but still cant get the
remote operation to work. When I finally give up,
the audio from the 2m side is nulled and have to
do a mild radio reset in order to get the audio back.
Audio I am not worried abt, but would like to remotely
do some function's on the 733. Maybe I, or Kenwood
missed something in the text, like maybe it only will
work using another Kenwood rig? Iam attempting to remotely
op the 733 from an HT. Would like to be able to activate from
an HT, say cross-banding on the 733 for hamfest's.
HELP!

The warning about household wiring was something I hadn't considered.
After reading your message, I have started to consider a different
location for the wire. I think I can get the center up about 20'-25' and
the ends about 12' by adding a couple of more bird houses in the back
yard. This would let me stretch it out above the back fence which is 72'
long. I'm going to try both for a couple of days and see which if any
will hear better. I'll be glad when the next exam day comes. I think I

have the written, now if the code will come.

Lewis

From: pmarkou@ferrets.iii.net
Message-ID: <3t6834$bjg@news.iii.net>
Source record: 215763

Does anyone have experience with the ICOM IC-31A? In particular does it have some of the same features as the W21AT like extended receive from 50Mhz - 999 Mhz? Any comments, both positive and negative, would be appreciated.

Also, how does the message paging option work?

Tnx,
Peter

I have had very good luck with my Alinco's. I started out with a DJ-180T and enjoy it very much. I bought two more for my boys when they passed their exams. I have since bought one more DJ-180T and a DJ-580T recently. They are not complicated, easy to understand the buttons, have a good audio, are modifiable (but I haven't done any of that), are rugged -- except for the little plastic tab that locks the battery on -- and have worked well over the years that we have used them. they don't have all the bells and whistles that some other radios have -- like a clock, auto power on, but they do have a scan mode and cover extended receive if you desire it. The 580 has a mode to cover aircraft band AM, but I haven't tried it yet.

The proof is in keeping what I have, and buying more of the same. Go for it. As I have found in the past, I have been able to sell something if I didn't like it. I have purchased and sold Kenwood TH-28A and 78A. Stayed with my Alincos.

You can usually buy a new TS-140S Kenwood and power supply for under 1000
bux at most of your ham radio stores.
I bought one about 5 years ago and have been using it ever since. The
only thing that has ever gone wrong with it is that the meter lamp burned
out once. Works on ssb, AM, and FM just fine and covers **ALL** of your
ham bands. Also makes one heck of a good SWL reciever too from 50K to
32M in coverage. It isn't a cadillac or rolls, but it does the job for a
heck of a lot less.

That is my opinion on the rig.

>Chris, N7RME

The supply + battery configuration works well for supplying high peak currents, provided the battery is in good shape. It also gives you a backup for emergency operation. Since the battery provides the reserve of energy for transmitting, if the transmitter is used infrequently a very small supply, running continuously, will keep it charged. The supply needs only to keep the receivers on constantly and have some reserve for re-charging. Drawbacks compared to a large supply are that the battery could require some maintenance and eventual replacement, and that the high current is supplied at 12.6 V rather than 13.8V , which may mean less output power from some transmitters.

Most supplies do not have internal protection to prevent an externally applied voltage from causing current to flow backward through the supply if it is switched off or set for a lower voltage than the external source. This condition may or may not cause damage, depending on the design of the supply. In any case, it is undesirable as it will discharge the battery during power outages. An especially dangerous condition occurs with supplies that have a "crowbar" overvoltage protector. Should this circuit be triggered, it will attempt to discharge the battery through essentially a short circuit unless a blocking diode is installed in series with the output of the supply. The diode must obviously be rated for the full output current of the supply. A Schottky diode is more expensive, but has lower voltage drop and thus less power loss (heat) than a standard one. For high current applications, a heat sink on the diode may be required. Also it's very important to put a fuse (larger than the largest expected load) in series with the battery immediately adjacent to it, to protect against any conceivable faults in the wiring or attached electronics. All the usual precautions about batteries related to hydrogen gas and sulfuric acid (both of those are present in "sealed" batteries as well) need to be adhered to.

If the supply has remote sensing, then connecting the sense leads after the diode will compensate for voltage drop in the diode. Otherwise, increase the voltage setting (usually an internal adjustment) by the voltage drop of the diode to keep the load voltage at 13.8 V.

If a regulated power supply is used in a parallel connection with other supplies or as a battery charger, it may run in current limit for a prolonged period of time. In order to prevent overheating, it is a good idea to lower the current limit setting of the supply to be approximately the continuous duty rating or even less. In most cases, the current limiter is set up for a current in excess of the "peak" rating, primarily for protection against short circuits, and continuous operation at that level will damage the supply. This way, in a parallel connection it is not necessary to exactly balance the outputs (which is most likely impossible anyway); whichever supply has the highest voltage setting will take up the load up to its rating, then the other one will pick up. In some models an internal current limit adjustment is provided, in others modification of a resistor value may be needed. Most of these supplies are built around the 723 regulator chip; a look at the 723 application notes will show how the current limiter works. Current limit is only "overload" if the current limiter is set too high.

: number I can call). Most of the counter help are worthless and obviously
: not motivated to sell me a few $ worth of misc internal hw. I don't have
: part numbers, nor do they!

: Advice?

: -dave

the rule of thumb for service and owner's manuals used to be this: take
the catalog number, for example 26-1234, add an MS in front and change the
- to a 0 (zero). MS2601234 is the service manual number. MH2601234 is the
owner's manual. some rs catalog numbers use a 3 digit prefix, 261-1234.
in this case the service manual number will be MS2611234.

you can order direct from rs, parts too, by calling 1-800-the-shack (cute
huh?). they mail direct to you and take credit cards.

so, you can call them, give them the number you derived, have them check it,
and order it if it's valid. if not, they can help you find the proper part
number.

i have no affiliation with rs or tandy corp...

Yup, I knew it was 50 ohms, but the fragility and susceptibility to jacket
damage from sunlight was something that I had not considered.

Thanks for the warning and advice.

From: freichert@aol.com
Message-ID: <3t9snj$pvj@newsbf02.news.aol.com>
Source record: 215710

I have an virtually new IC737A has only been out of the box for a grand total of about 5 hours in just about a year. Has 250 Hz. cw filters in both IFs (over $200 option) and the extra technical service manual. Modified for gc tx (MARS). Would like $1200 (recent flyer from AES had used one for $1299 without extra filters or service manual).

5793. Low RFI CRT recommendations?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-03 00:00:00 UTC
From: slay@netcom.com
Message-ID: <slayDB5z7u.KLI@netcom.com>
Source record: 215711

I'm looking for comments & suggestions on a good 15" or 17" color monitor for use with my Mac2si and/or my Windows machine. I've heard that CRTs can be very noisy (ie. RFI) when used in proximity to ham gear. I've been using an old MacSE next to my FT-1000 w/o any discernable problem ..... but I have some fear about what'll happen when I upgrade my system shortly. Any thoughts or experiences out there?

Thanks.

5794. Re: 6 m AM rig, Does anyone use them?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-03 00:00:00 UTC
From: jlamar@yrkpa.kias.com
Message-ID: <3t931g$5vn@yrkpa.kias.com>
Source record: 215712

Erik,
My guess is that the rig you are being offered is a Gonset G-50.
In its time, it was the Caddy of 6 mtr AM rigs.
Although SSB on the low end and FM on the high side, it might be fun to
give it a try. Back in the 'Old Days' I worked 47 of the 50 states.
When the band is open it's a fun band.

-= 73 =- john k3nxu jlamar@yrkpa.kias.com

: I know that AM is old technology and SSB is what is used these days, but I
: can get my hands on a 50 watt 6M AM rig. Now my question is, does anyone
: out there use AM at all anymore, or would obtaining the (almost free) 6M
: AM rig be almost not worth the time. I know that 6m hasn't been used much
: lately, but is it at all practical for me to do this...

: Thanks in advance.

>= I seem to remember something like R57, but I'm not sure...
>=
>=Greg Becker NA2N
>=gb546@bard.edu
>=

Open up the case. Looking from the rear, you see 4 blue (or
black) pots in a row, with small screw adjustments on them.
The first on the left (R76) is the deviation adjust.
You optimally want 3Kc to 3.5Kc deviation for 1k2 or 9k6 baud.
Or if you do not have the equipment for measuring, tune
so that your signal is not louder than the nearest node when
it sends a *nodes*.

The next pot right is R77 and adjusts the tones for 1k2 baud.
Do not adjust this unless you have the equipment.

The other 2 pots are for adjusting the 300 baud HF side.

R57 is the resistor that can be removed/changed if you do not
have enuf deviation when R76 is up full.

The JMP4 is the watch-dog timer defeat jumper so that your
Tx can be longer for calibration. Remember to remove this
when your done! Use "Calibra" to put the tnc into calibrate
mode and use K key to on/off the transmit and space bar to
switch tones. D alternates the tones and Q quits calibrate
mode.

Have fun.

>Thanks & 73,
>Greg

R76, the one at the end of the row of four adjustable pots is the one that adjusts the tx audio output level to the microphone.

The manual suggests using a meter attached to a receiver on the same frequency as the radio/tnc combo you're adjusting, to use the calibra command (d to shift tone freqs, k to toggle tx, q to quit) to get the radio transmitting with the high audio tone, and to adjust R76 until the audio level on the receiver goes no higher. R76 is then backed off until the audio level drops a little.

A better way is probably to use a deviation meter to set deviation at 2-3 KHz.

5801. This is not buy & sell

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-03 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <c85_9507030112@mba.mba.org>
Source record: 215778

Well, I just saw a post here from seckert@ix.netcom.com (Scott Eckert)
who's trying to sell his 286 system. Considering that he included
a call sign, I can't believe he did it.

So there was a thread here a while ago about how this newsgroup
is for discussing commerical equipment, not for posting ads for
buying and selling it. I just checked, and out of the 25 posts
that have arrived here since the yesterday when I checked in,
8 had subject lines that clearly indicated buying and selling.
Six were for sale, the other 2 were form people wanting to buy.
I know that the name of the newsgroup can be confusing, but
can't people be a little more aware of what's going on?

What is worse is when people not only make the mistake of
thinking it's okay to buy and sell here, but start selling
all kinds of non-amateur radio equipment. The above
mentioned 286 post is one. But in the past two weeks or so,
I remember someone else posting a for sale ad for some computer
system here, and I'm not even paying attention.

I do notice that there are a lot of buy and sell type ads.

It seems to make snese to post this generally than to email
the guy selling his 286, since it's clear that people are posting
their buy and sell ads because they keep seeing other people
doing it.

I've seen RJ-45 (the 8-pin modular) connectors on the shelf of
the local Radio Shack, or any place that deals with computer networks
should have them--they're the same as for 10bT Ethernet. The network
places could also sell you a pre-made RJ-45 to RJ-45 cable which would
give you two wired connectors.

Get the service manuals. The one for my HTX-202 cost, as I
recall, $6.59; I'd suspect the -404 would be similarly priced. If the
counter-droid says "Huh?" when you ask for them, have him/her call either
Consumer Mail or National Parts for the appropriate information. The
part number on my HTX-202 service manual is MS-1901120; I'd guess the
number for the -404 manual would be MS-1901140.

SPECIFICATIONS

Frequency Coverage: 530KHz-1650MHz, including full 800Mhz
Modes: AM, NFM, WFM, LSB, USB
Increment Steps: 50, 100Hz (LSB/USB only), 1, 5, 6.25, 9, 12.5, 20, 25, 50
100KH (100KHZ only on WFM)

Sensitivity:

0.53 - 2MHz
AM: Less than 10uV(S/N 10db)

2 - 30MHz
AM : Less than 1.5uV (S/N 10db)
LSB/USB: Less than 1.0uV(S/N 10dB)
NFM : Less than 1.5uV (SINAD 12dB)

30 - 100MHz
AM : Less than 0.5uV (S/N 10db)
LSB/USB : Less than 0.5uV (S/N 10dB)
NFM : Less than 0.75uV

1000 - 1650MHz
NFM : Less than 1.0uV (SINAD 12dB)

Memory Channels: 1000 (10 banks of 100)
Search Banks:10
Search Pass Channels: 500
Scan Speed: Approx 30 channels per second
Search Speed: Approx 30 steps per second
Delay: Approx 2 seconds (standard) or 5 second

Dimensions:644(w)x155(h)x38(d)mm
Weight: 320 grams
Antenna Connection: BNC Fitting

Supplied Accessories

4 x AA Nicad batteries, AC charger (12v DC, 200mA output), BNC telescopic
antenna, Belt clip, wrist strap

Yupiteru soft vinyl pouch with clear plastic windows over screen and
keypad.

Condition:

Radio has NEVER been used outside of the vinyl case and has no marks or scratches.

Radio is in MINT condition. I purchased the radio new from Javiation in the UK.

US $475.00

5806. Opinions wanted on Kenwood TH79 AD HT

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-03 00:00:00 UTC
From: bes@ihnns721.ih.att.com
Message-ID: <DB5vA9.GE4@ssbunews.ih.att.com>
Source record: 215783
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I've decided on Kenwood's TH79 AD HT and would like to hear any opinions
on this model.

I also have a few questions.

Is the few extra bucks for a 2.5 to 5 watt upgrade worth it? I know range can
be affected by many other variables but on the average how much more range will
it give me?

Does the 5 watt battery last as long as the 2.5 before a recharge? How long
do they last on average?

What kind of mods can be made to this unit and where?

I know there is a 12 volt adapter for mobile use but is there an AC adapter
so I can use it in my apartment? Or can I use it as it is being charged like
some scanners for example AC cord with transformer that plugs right into
the unit as opposed to a charging stand.

What is the best price I should be looking for and where (from a reputable
mail order company)?

A friend is also considering the TH 28A and TH22 AT single banls anyone
know the major differances between these two models?

Any help is greatly appreciated.

Thanks
Bob

VE2PAL/TPK 1.81 Msg #:17 Le 31/05/93 a 8:27Z

Subject: TM-742/942 Beyond Mars/CAP Mod. Guide

Procedure:
1. Detach the front panel from the main chassis.
2. Remove the bottom cover of the transceiver by removing the 4 screws on
the bottom of the cover and loosening the 4 screws on the side of the
unit.
3. Orient the radio so the bottom is up and the front panel area is near
your chest. Near the front panel area you will find a large board, this
is the control unit.
4. Remove the chip resistors "Y" noted in the diagram below, and reinstall
them in position "Z" as shown.
5. Reinstall the bottom cover of the transceiver and reattach the front
panel.
6. Reset the microprocessor. Press and hold the MR key while the power is
switched on. Then release the MR key. This will erase all operator
programmed data.
7. The frequency range after modification will be:

28 Mhz Band: RX: 18.0 thru 54.0 Mhz
TX: 26.0 thru 45.0 Mhz
50 Mhz Band: RX: 40.0 thru 90.0 Mhz
TX: 46.0 thru 76.0 Mhz
144 Mhz Band: TX: 136.0 thru 174.0 Mhz
220 Mhz Band: RX: 215.0 thru 260.0 Mhz
TX: 215.0 thru 235.0 Mhz
440 Mhz Band: TX: 410.0 thru 470.0 Mhz
1.2 Ghz Band RX/TX: 1100.0 thru 1400.0 Mhz

Please note that these are theoretical ranges only. Not
all radios will be capable of tuning the entire range.

My Ic 745 is having a problem it's not wanting to get on frequence when you turn it on. Could this be that the Battery in the Radio is going dead, since it works fine once you are able to get it on frequence?

From: geoffs@onr.com
Message-ID: <3t96aa$bdd@Sierra.onr.com>
Source record: 215791

I've posted this to several Usenet rec.radio.* groups, thanks for your patience if you've run into it previously.

I recently acquired a super clean R70 at a very attactive price. It's got a few shortcoming that I'd like to remedy.

First, I need the service manual with all of the alignment instructions, specs and schematics. I can probably buy one from ICOM but those things sometimes get left behind when an owner sells the hardware. I have the operators manual already.

Secondly, anyone got an FL-44 or FL-63 (I'd like both) for sale? Anyone know of a Fox-Tango equivalent?

Finally, there's a Murata 455kHz AM filter that's leagues ahead of the cheapie that's standard in the R70. It's called a CFU 455 I or CFU 455J. Murata stuff's hard to get these days. Anyone got a source or a spare one?

Thanks again.

Source record: 215792

I was wondering if anyone has tried this. I have a Tripp lite 40 amp power supply and the current draw on my new amp is slightly too much for it. It shut's down for a few seconds and then resets itself. My question is. Will it hurt them if I buy another power supply and hook them up paralell so I have more amps avalable? I'd rather buy a smaller supply say 10-15 amps to add on rather than a whole new bigger power supply. Thanks

Jason

Are you sure? If you analyze the screw holes as waveguides below cutoff, the attenuation (in dB) is proportional to the waveguide length and inversely proportional to the hole diameter. Thus, for 1/16 inch holes in 0.015 inch sheet metal, I calculate only 7.7 dB of attenuation at HF. Thick metal plates look really attractive when making UHF amplifier ventilation holes.

How much attenuation do you estimate?

5819. Alinco Re-Written Manuals

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-03 00:00:00 UTC
From: Jay_Appell@cac.stratus.com
Message-ID: <3t98nu$f0o@transfer.stratus.com>
Source record: 215796

As a consultant for Alinco years ago, I was tasked with many areas. One area was to review how manuals were written. At that time Alinco wanted to stay one step ahead of the competition by adding American written documentation. The manuals are in computerized form and in some cases include pictures drawn up by an artist (560) but never released.

As many of you might already know, I tested and wrote manuals for the 560, 590, 599 and 600. From the response I got, the amateur radio community enjoyed the change. From Jinglish to English, the manuals gave the amateur operator more of what they wanted such as battery measurements, modifications and easy to follow instructions!

If you are the owner of one of these radio's, These manuals may be obtained from the CMP Bulletin Board. The telephone number is 508-478-9200. I will be making the Alinco area of the board FREE no later then 7/4 pm. In other words, files from the Alinco Forum will not require you to be a member of the bbs.

To bring you up to date, Alinco does not enclose my re-written manual in the form that it was presented. It re-prints it in a smaller, and in my opinion unpresentable format for the ham operator. They decided years back to go back to Japan and have the manuals written and printed there due to costs. The organization at Alinco in general are very pleasant and was a privilege to work with. I have received over 2 thousand inquiries and have met some very nice people along the way.

For an additional cost, I would be happy to send you a printed version along with any special notes that I might have. Please send me mail if you fall into this category.

If you wish to write and say hi, please feel free in doing so.

Thick Ethernet cable looks a little similar to RG8/213 except for the color of the jacket and its having a tinned core and the double braid. Does anyone have any experience or advice on how this stuff works as an H.F. antenna feed cable? I have the opportunity to buy some and would appreciate any comments before it all disappears :-)

Thanks for any advice.

Interesting idea. I suppose that if both supplies are diode outputs, such that current from one can't be dissipated into the other, then they shouldn't be able to harm each other. The other question is one of sharing. Will one supply wind up providing more of its current share than it should? I would start by carefully adjusting each supplies voltage seperately to be the same value at say 50% load capacity. Then when you first try it on your equipment, check the current out each supply to be sure neither one is overloaded. The last trouble is one of voltage regulation. A regulated supply mantains the correct voltage by measuring its own output. Thus you will need to determine if the point at which the output is measured is before or after the output diode. If it's before, no problem. If it's after, then both supplies will be regulating off the one with the greatest noise or highest voltage. This is what I expect you would find, as taking the measurement before the output diode would cause an error due to the drop across the diode.

What I do is use a 10amp supply and about 20amp hours worth of gell cells. This keeps the VHF/UHF radios all going nicely. For field operations where I can get an AC line, I use a car battery and an automatic charger to keep it up and happy.

The IC-M700 is a marine radio first. Until July 1991 the Marine ITU frequencies did not go above 23.999 MHz so there was no need for the radio to operate above that frequency. The M-700 was never changed and will not operate above 23.999 Mhz.

Bill's right. Ethernet cable, thick or thin, is 50 ohm and always has
been. I swap cables between antenna feedline and ethernet duty as a
matter of course; they're all the same in practice modulo the fire
code, which at home I can ignore.

> mode too.

What I heard was that the IC-706 is strictly vapor-ware at this point. The story goes that Alinco hired three engineers away from Icom, and boy did that get Icom pissed off. So when Alinco started the promotion on their own new DX-70 rig, Icom started its own promotion on the IC-706 and offer something even better. So where Alinco advertises a rig with 100 watts on H.F. and 10 watts on 6m, Icom advertises a rig with 100 watts on H.F. through 6m plus 10w on 2m.

I'm sure they'll actually start delivering some of these cute little rigs by the fall, but for now I wouldn't hold my breath.

As I said, this is a story I heard from a major dealer. But it may be untrue. And if anyone knows that there exists a real testable and deliverable IC-706 somewhere, that'll prove that the story is untrue and sour grapes.

Hands up anyone who has touched a working and deliverable IC-706?

>modifications available? How long has this model been on the market? Are
>you pleased with your selection of this rig? Your comments, both good and
>bad, would be appreciated. Tnx and 73 Bob

I've had a 990 for about a year and a half. Great rig. I added the optional 250Hz CW and 2KHz SSB filters, which I highly recommend. I'm mostly interested in DX on 20m and find the 990 works exceptionally well. Matter of fact, my biggest complaint was that the receiver seeme to work a little _too_ well: there were always _loads_ of stations I could hear pretty well but which I just could not work on only 100W. For that reason, I have since bought a used Yaesu FL7000 linear, which has solved the problem: I hear most anything on the band and can work most anything I can hear.

Before I bought my 990, I did a lot of work comparing this rig and this manufacturer with the other choices out there. To me it seemed that the 990 had a good feature complement (e.g., 10-key pad, good smooth tuning, lots of filter options, separate packet and rtty modes and connectors, good readable display) and overall, good ease of use. I judged it as quite a bit easier to use than, say, the comparable Kenwood units. Also, compared to Icom, I found Yaesu to be much more helpful on the phone when I call the manufacturers asking for information about their products and why I should buy one of their rigs. (Despite several calls, all answered by machines, Icom never even bothered to send me literature 'till months after I'd already bought the Yaesu. By contrast, when I had a technical question about the computer control i/f in the 990, Yaesu put me right thru to a fellow who who knew it cold and was ready to answer every question I could think of.)

My only negative comment about the 990 is the curious way they've positioned a row of buttons across the bottom, hidden under the much bigger knobs in the row above. To me, this is a bit inconvenient as you can't read the legends or use these buttons w/o scrunching down to see them. I think it would have been better to swap that row to the top, moving everything down to make room.

You'll definitely like the 990. It's a very good design, giving you virtually every bit of the performance of a truly top-end rig (like the 1000 or the 781) but at far more manageable price. These days, I think the only other rig I might possibly consider if I were out buying a new rig today would be maybe the new Icom with

the built-in DSP, though I admit, I don't know the price of
that unit.

Any ideas Id appreciate...have been noticing that after a long warm up
period the tuning gets very jumpy...ie, not a smooth one for one match of
frequency change per dial rotation. Its not bad right after power up, but
after a few hours its murder. A simple solution? In its defense Ive gotta
say its the only problem Ive ever had with it in 10 years.

Tnx in advance...rich, K0ZX

David,
To order the parts you might try calling 1-800-THE-SHACK (I know, the
"K" is not necessary but is it is easier to remember it that way).
I've never tried to order CMC or national parts thru it, but it might
work. Also, go back into the store and ask for the phone number to
the local DSM. He is in charge of those stores and will not be happy
about the "non"answers you've gotten.

Go for it. It's one of, if not the, simplest TNCs to use. I've been a KAM fan
since 1989. Sold my old KAM for a KAM+.

The AEA-232 is a pain in the ass to set up. I tried setting up 2 of them for
fellow hams and got so frustrated, I was ready to throw them out the window.

The MFJ line is ok, but no dual port at the time I was looking at the original
KAM.

Multi-mode HF and VHF packet in the same TNC. Can't beat it.

Remove the (tiny) green zero ohm resistor next to the CPU under the lithium
battery. Since you have to disconnect the battery to do this, all the
memories are likely to be erased.

Not illegal to use 420-438 MHz, which the manufacturers seem to think is not
in the US ham band... I smell Conspiracy.

5846. REAL extended recv range for IC-W2A

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-04 00:00:00 UTC
From: ROSLEWSKIRB96%CS26@cadetmail.usafa.af.mil
Message-ID: <ROSLEWSKIRB96%CS26.214@cadetmail.usafa.af.mil>
Source record: 215739

Does anyone out there know the REAL extended receive frequency range for the Icom W2A? It'll display just about anything, but won't receive all that. In fact, I have noticed that, while tuning through the _displayed_ range, I can receive the same station (repeater, whatever) at a couple different _displayed_ frequencies (separated by several hundred MHz), which suggests that the _real_ receiver "loops over" at some point. So, has anyone done any scientific testing, or otherwise know what the _real_ receive range is (for both VHF and UHF)? In case it matters, my radio's serial number is 07232.

Thanks a lot!

5849. "Business" and autopatch with HAM??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-04 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3tao3n$g58@usenet.INS.CWRU.Edu>
Source record: 215742

I am not yet licensed, but am trying to get there very soon. Most of
the reason for wanting to get into the HAM area are definatley not business
but rather recreational, as well as keep in touch with my wife and other
family members wiht out the expense of a cell phone. But there is one reason
that I am curious about. I am a High School teacher. I like to do a little bit
more than the the average teacher in terms of patrolling the halls. I am trying
to get the admins to let me check out a radio to communicate with them, but it is
likely that they will not. ANyway, the point is that while I was considering
buying a cell phone, this is one of thebiggest reason for getting one...so that
when I got into a situation where I needed a police officer and/or an admistrator,
I could call for one.

So, would this be considered "business"? One person suggested that as long as it
is not for profit...well, not much as a teacher is for profit...including the
salary. So what all is acceptable? WHat is that fine line?

Thanks for any comments!!!

5851. Best 2m HT for repeater activity?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-04 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3taoug$gg4@usenet.INS.CWRU.Edu>
Source record: 215744

I am still tyring to pick the best 2m HT. I also would like to be able to recieve 155, 460 and 469 mhz, either as a feature or as a modification. THe thing that I will want to do most is be able to hit a repeater without having to hook up to an external or extended antenna. One fo the guys at Universal Radio tried to explain that some of the models are worthless for more than 2-3 miles, and that there was a difference in the models in terms of how sensitive the receiver was or how well it would transmit to a repeater. I don't know how far away the repeaters are, but tI know that there are 6 in the nearby area that are capable of autopatch.

So what, if any, would be the best model for reaching a repeater with stock equipment??

Thanks for any comments!!

Neville,
I have a Yaesu FT767 for sale. It works all HF bands plus 2 meter
all-mode. Has slots for 440 Mhz and 6 meters. Comes with tone board for
repeaters. 100 watts out on HF and 10 watts other bands. It has digital
readout, mike, manuals and is in new condition. Works absolutly great
with 87 countries worked in last year. Will sell for $1300.00.
Call me if interested at 312-254-8981(home) or 708-825-9070(work).
Thanks, Jeff (N9YIH)

Hey guys guess what you can get it in both 75 and 50. I have a section of it
that is marked montrose 5713 which is 50 it has the same teflon covering that
is on rg142/u I agree it is not the best thing to hang outside but it will hold
up for a year or two. Biggest plus is I got 130 ft of it for 32 dollars and that
was with N connectors install on each end. ;)

Source record: 215602

Here in the UK someone I knew once described Alincos as the "Skoda" of the ham radio world, but I've never seen a Skoda in the states so maybe that won't make much sense over there.
I bought a second-hand Alinco 510 from an american ham living here for a few years and I would strongly reccommendd them.
They are physically and electrically robust and have more than enough bells and whistles on for me.
I find the 510 particularly good on UHF and the reports I get back are always good.
They do extended receive too, which everyone seems to want nowadays which is odd because we NEVER listen to things we're not supposed to, do we guys?

5857. FS: Battery Packs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-05 00:00:00 UTC
From: jbls@aol.com
Message-ID: <3tdtu6$p03@newsbf02.news.aol.com>
Source record: 215651

WHY PAY $50 - $75 OR MORE FOR A BATTERY PACK FOR YOUR HT?????

External battery packs-----just name the DC voltage you need and I can make it!!! They are rated at 1AH. Higher amp hour available at additional cost. Your radio or scanner or whatever needs to have a built-in jack for external DC power. The size and type of input jack must be specified (example: 2.1mm co-ax positive center tap). The pack can be attached to your radio using heavy duty velcro (supplied). The pack is supplied with a VAC wall transformer for charging. A built-in-the-pack VAC charger can also be ordered for an additional $15.00 per battery pack.

7.2VDC $20.00 (approximate size: 4" x 2.5" x 1")

12VDC $26.50 (approx. size: 6" x 2.5" x 1")

14.4VDC $35.00 (approx. size: 4" x 2.5" x 2")

Higher voltages are also available.

I can accept postal money order, personal check (held for clearance) or COD. I ship UPS. Shipping charges are $5.00 for the first pack and $1.00 for each additional pack (maximum of 10 packs, additional (minimal) shipping charges apply for orders in excess of 10 packs due to my additional cost). COD is $5.00 extra.

>over the prints i noticed a pin marked Clone on one of the
>connectors for the external speaker mic. Will this work and
>how do you enter the clone mode on this radio.

As I understand it, the 530 does have a clone mode which
Yaesu uses to download and upload freqs into the rig during
repairs. I've followed (and initiated for that matter) threads
discussing this, but no one seems to know how to enter the mode,
and Yaesu isn't telling.

As far as the PC program, I don't believe the present
version for FT51/41/11 will work with the 530, but I thought I
heard rumors of the same people who wrote that program working
on a version for the 530. I have my fingers crossed, and will
buy it when it shows up. I'm watching this news group for that
info!

That's what I know. 73.

: Well, I've asked about every other type of radio there is, so now
: I'm looking at an Alinco. I notice they seem to be good radios

I've had good results with my DJ-180T (2m) HT. Only complaint is that memory scanning is slow and the stock unit has only 10, one of which is the "call" freq. It puts out a good clean signal, and is very sturdy. It doesn't get hot to the touch during prolonged QSOs (like my elmer's Kenwood does), and it was much less expensive than a comparable Kenwood. I've not had any problem (cost or availability) getting accessories.

When I get ready for a dual-bander, I'll probably give very serious consideration to the 580 HT or the 600 mobile unit (which has some really neat cross-band repeat and other features).

I have really been trying to decide on a 2m radio. I posted a note about the influence of mods in determining which model. I thought I would ask more specifically. Does anyone know of any mods on any of the HTs that will allow receiving of CB (or even better, send on CB)? Or that can pick up the 460 frequencies? Most of the police bands around here are at 460 and it would be nice to be able to receive these without having to carry a scanner and a 2m HT.

THanks for any replies!!

I had one of the first PK-88's by AEA. I had several problems with the PK-88 and sent the unit back several times. I even spoke with Rod Pocter, the firms president. Other pk-88's worked fine, but Rod assured me that my unit was operating fine and that the problem was due to the user. After several tests, with "experts", I determined that the pk-88 was at fault. Rod was quite nasty on the phone. He wouldn't replace my waranteed unit. He insisted it worked within tollerance. I ended up trashing the piece of garbage because it only allowed connection to other stations about 60% of the time!

Briefly, I swapped my unit for an "identical" pk-88 twice. Both of the other pk-88's worked fine with my station. I put back the original pk-88 and again failed on about 60% of the connections. I made sure all settings were the same.

I quickly bought the older KAM all mode used. I plugged the connectors into my existing vhf radio, keeping all the settings as they were. Wala, no more problems. I want to someday connect up the hf side for rtty, and other modes. I have only been using the vhf port, but I never found a better, more stable

tnc!

I'm posting this for a friend.

He is looking for a Yaesu FT416 handheld 2m FM transceiver in good working condition. Production of this model was discontinued about a year ago.

If you have one of these and would like to sell it, please reply to me by email or contact Barry Bateman at 604-888-5658 (collect calls ok).

This being the case, is there a newsgroup for buying and selling. If
so, why not educate everyone so it doesn't continue?

Be careful about this. This will blow the regulator chip of some
power supplies if the PS is turned off before the batteries are
disconnected.

>appreciate any comments before it all disappears :-)

It's similar to well shielded RG8. I have a 2 meter antenna fed by
thick Ethernet, works fine. And also used some in the HF station,
works fine.

Be sure to check any used Ethernet for "vampire" tap holes. Depending
on how much power you're going to run, the tap holes shouldn't
much matter, only thing is water could leak in outdoors.
Don't worry about it saying something about 50V max, that is there
only to make building inspectors happy that the cable wasn't being
used to conduct powerline voltage. It can handle what foam RG8
can do.

The appropriate newsgroup for buying/selling/trading is rec.radio.swap.
This is described in the Guide to the Personal Radio Newsgroups that
is posted here (and elsewhere) every month.

'Twould be nice if people would actually read it! 8^{)

I own the TM-732A, the predecessor to the TM-733A. As David mentions, there is a fan on the back for cooling. The unit works great and was easily modifiable for MARS, and other freq's. However, I have heard rumor that the Yaesu has better intermod rejection. I do have problems at home and in a pager ridden town with intermod on 440mhz. I have rarely had problems on 2m, but I am sure I'll see problems there too sometimes. External intermod filters are available, but many people have told me that Kenwood is among the worst at intermod rejection.

I might note, that for the dollar and the name, Kenwood seems to me to be the best buy. I own 6 kenwood rigs, of which 5 are less than 1 year old. I have had some trouble with 2 of the rigs when they were new, but Kenwood and AES were very quick to solve my problems in all cases. Kenwood took special steps to keep me a satisfied customer. I also had problems with the PC-1A phone patch from Kenwood, but after 3 replacements directly from Kenwood, I finally got one that worked.

In talking with others, the other big manufacturers don't have any better quality control.

I have heard that Standard is also excellent at intermod rejection. If you live in a highly congested area, I would advise seeking reports on rigs and intermod rejection. Otherwise, I'd definitely stick with the Kenwood.

5876. Yaesu FT-530 Can this radio "clone"??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-05 00:00:00 UTC
From: ldanna@ix.netcom.com
Message-ID: <3td04e$f95@ixnews6.ix.netcom.com>
Source record: 215670

I have recently purchased a Yaesu FT-530 radio. I noticed
that in QST that they reviewed a program that can load setup
information into the radio via the "clone" mode. The article
did not indicate if this can be used on the 530. In looking
over the prints i noticed a pin marked Clone on one of the
connectors for the external speaker mic. Will this work and
how do you enter the clone mode on this radio.

any info is appreciated. 73 Larry Wa3kok

I've had my Alinco DJ-F1 for about three weeks, and I think it's a great radio for its size. But I'm
not really interested in "bells and whistles." If you are, you might prefer another model or another
brand.

5878. Motorola HT1000 versus Radius GP300

Newsgroup: rec.radio.amateur.equipment

I've decided to buy a Motorola HT for use on the 2m band (for various reasons) and would like opinions on the two I've narrowed my choice down to: the HT1000 and the Radius GP300.

Which would you choose, and why? Are there any other models I should be considering besides these two?

I have seen some older Alinco and Kenwood gear. I in fact own a fair amount
of Kenwood gear. Most of the Alinco gear did not hold up as well over time as
did the Kenwood gear. If you are considering durability, I have been happy
with Kenwood and Icom. My friend is selling somones Alinco handheld. That
handheld has all kinds of problems including bad display, poorly designed
battery mount and more.

Also, just like other name brand stuff, what holds a better resale value? For
example, if you were selling a 6 year old car, which would sell for more, a
Toyota Corola or a Hundai Excel, assuming similar options and condition?

>Any other radio that someone thinks it's a better buy than the
>DR-600T?

I own several pieces of Kenwood gear. I have been extrememly happy with all
of it. I have 2 dual banders and one tri-bander. They all seem great.

Some mention that the Kenwood has intermod problems, but if they become a
problem, external rejection units are available. I have also heard that the
Standard brand has better intermod rejection. I think of Alinco as a knockoff
brand. I don't believe it is very durable. If you have to get a rig and
can't spend the bucks for an Icom Kenwood or Yaesu, or even the Standard, I
guess an Alinco would do. I guess you could say it was like going to RAIDO
SHACK for a ham radio!

Oh, by the way, I am against RADIO SHACK because they don't make it a habbit
to screen out non-hams when selling ham gear.

I own a TS-850 with the tuner. What a fine rig. Most people who buy the TS-140S or the TS-440S usually ask what it would cost to upgrade to an 850S or an 850S/AT within a year. I saw a used TS-850S on the Internet recently for $820.00. This is an excellent deal. For a good Solid state rig, you'll definitely spend over $600. The best, inexpensive deal available is the Icom IC-735 used. Most TS-850S rigs go for around $1,300 used. With my TS-850S/AT and a G5RV antenna, (before I got an AMP), performed so well. My $50 antenna at 16 feet above ground gave me regular reports of 5x9 to +20db. If you can afford to get the TS-850S, you can perform many upgrades as money rolls in! I'd say, if you can't afford the TS-850S, spring for the IC-735. If you can buy the TS-850S, skip the TS-440 and TS-140 and go for the gold!

I should mention that the TS-950SDX is the Kenwood top of the line, but according to many articles I read, you'd get a lot more features than with the TS-850S, but not a better radio!

> Thanks for the help in advance...Tom, WA3REY

Tom,

It is not clear exactly what you are doing with this, but I have experience on the TM-732A and TM-742A for crossbanding and utilizing memories. I suspect you programmed frequencies and their settings into memories, but can't figure out how to get out of crossband mode while in crossband mode.

If you have entered crossband mode, you get out by holding the function button down for more than a second, until the function indicator flashes on the display. Press the last key in the main row I believe the MUTE key. This will end the crossband mode. Note: In some setups, if you are receiving a signal while crossbanding, the rig will not respond to key functions. You must disconnect the RECEIVE antenna, (make sure it is the receive antenna), and then you will be able to disable crossband mode. This is especially true while using the remote control function.

If you don't know how to setup crossband, here goes:

Setup the first freq. in the top window, with all the right settings. Setup the second freq. in the bottom window, also with all the right settings. Press the band select button (the one on the volume control knob of the band which is not the main band. Press the csel button, (the unmarked one by the squelch control knobs). Wala, you are in crossband mode.

Good luck

John - WD9AIS

You must be the luckiest ham in the world! AEA DOES NOT stand behind the
TNC's they sell.

When AEA first came out with the pk-88, my father bought one, as did many of
his friends. About 1 1/2 years later I decided to get into packet and I also
purchased a pk-88. My father and many others were using hand held
tranceivers, while I was using a good stable Kenwood mobile radio on a power
supply with a UPS attached. I was planning to leave my unit on 24 hours a day.

My father was using a quarter wave whip and 5 watts and was able to connect
with people as far away as about 20 miles. He moved my s-meter by about 4 to
5 units, but I got so many retries, I assumed I was too far away. I found
several people, (about 60%), I tried to connect to required several
painful retries to stay connected with. Around 40% of the people I tried
connecting with would time out due to excessive transmission or receive
errors.

One station I tried to connect with regularly was only about 6 miles from me.
He was exhibiting a +60db signal. No luck, I kept getting errors and retries
and eventually timeouts on every attempt. People, including AEA people kept
telling me there were so many possibilities, that the problem is probably my
older radio or its settings that were incompatible. I thought I may upgrade
the radio sometime later.

When the TNC was about 9 months old, and still under warantee, my father
suggested I switch TNC's with him and see what happens. I found that I no
longer had problems connecting to others, but my dad acquired all my previous

problems. I switch back and the problems came back. I then switched with another pk-88 owner and I connected to my dad every time with no problems. I contacted AEA, and they suggested sending the unit back.

I sent the unit into AEA with a note including a description of the problem. I got the unit back within a week to find that nothing improved. I called AEA and they said they threw it on the bench quickly and it appeared ok so they sent it back. I again sent the unit to AEA, again at my cost (2nd day air). The unit came back once again with the note, Tested - OK. The unit again failled all my tests. I then wrote a letter to Rod Pocter, the firm's president. Rod was very nasty. He insisted that his technicians are the finest. He said there was nothing wrong with the unit and his decision was final. I asked that he replace my unit with a new unit and he refused, telling me he couldn't afford to do this with everybody who complained. I told Rod I was dissattisfied with his product and wanted a refund. Rod again refused. I told Rod that I'd tell everyone I got a chance to tell, of his poor service to customers, and he said, "I don't really care what you do", before he hung up on me.

Before anyone buys an AEA TNC, you should consider their service and return policy carefully. I had to give away the $90 piece of AEA junk and get a real TNC made by KAM! Don't waste your money like I did!

Tom,

As I still say, don't believe there is anything wrong with what you are doing. Although it is possible you haven't adjusted the rig right, I thought I'd give you my 2 cents on AEA's policies on their TNC's

When AEA first came out with the pk-88, my father bought one, as did many of his friends. About 1 1/2 years later I decided to get into packet and I also purchased a pk-88. My father and many others were using hand held tranceivers, while I was using a good stable Kenwood mobile radio on a power supply with a UPS attached. I was planning to leave my unit on 24 hours a day.

My father was using a quarter wave whip and 5 watts and was able to connect with people as far away as about 20 miles. Thought of that. What I did was to determine what the supplies output cicuit was like. Mine has an ouput diode, and a high impedance feedback circuit for the regulator. I've been using it for about 21 months now. And while some of my amateur friends believe me a little strange for the practice, I do turn the radios (and the supply) off at night. I see only a very small voltage drop over night. It's a long time since I measured it - can't quite recall the value.

>I read their brochures and it almost have indentical features.
>
I own the TM-733A. I'm very happy with the rig. Although, the
FT5200 has the antenna duplexer built in. This could cost you
another $50 for the Kenwood. I also feel a bit better about the
FT5200 heatsink configuration. The Kenwood has no heatsinks
on the back. Only a small fan that runs to keep the unit cool.
The Yaesu is a bit larger than the Kenwood. They are both
fine radios and you should feel comfortable purchasing either
one in my opinion.

Buy It!
It's a great TNC. However, the PK232 KAM Bashers will tell you that you'll
never use the dual port feature. I use the dual port feature all the time.
I monitor the local DX cluster on the VHF side and work RTTY or PACTOR
on the HF side simultaneously most of the time. The KAM is VERY easy
to get hooked up and going. Don't jump for the Hostmaster software from
KAM. I think XPKAM, available shareware for $39, is much better and less
expensive.

I am looking for the CAP mod for the Standard C5718DA dual band radio and have not had any success.

I looked for files at ftp.cs.buffalo.edu, ftp.cs.tamu.edu, and at oak.oakland.edu without success.

I even struck-out with the two copies of the radio mod books that I have.

Has anyone found a location with this information, or have you seen it posted here on the net? Better yet, do you have a copy that could be forwarded?

Thanks for any help you can offer -

5897. Icom Z1A 440 Mhz problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-05 00:00:00 UTC
From: js024b@uhura.cc.rochester.edu
Message-ID: <1995Jul5.222623.14415@galileo.cc.rochester.edu>
Source record: 215691

I am having a problem with my Icom Z1A which I bought in March. I can't seem to trigger any repeater with the standard battery (1.6w) or through my car's amp of 25w. 2m works fine, I can even trigger that band in my apartment, but 440 won't transmit at all (Rx is just fine) and that is with the rubber ducky and an external Larsen 2/70 glass antenna on my car. I don't want to send the unit in for service unless I really have to, but I guess I will have to. Does anybody else with a Z1A (or the equivalent W31A) have a similar problem?

If I do send it back, would it be better if I send it to Icom or to AES where I bought the radio?

Thanks.

Yellow Ethernet cable is for interior use only. The ultraviolet will ruin
the insulation. If you enclose it, it might be OK, such in a conduit.
The impedence is 50-52 ohms. There might be some 75 ohm but I've only
seen 52 ohms.

>
>Hands up anyone who has touched a working and deliverable IC-706?

Well I've touched the IC-706 at Ham-Com in Arlington, TX last
month. The working unit that Icom was displaying did not transmit yet,
but the radio looked like it could be a winner if they finally pull it
off. It has a green background display like the ol' IC-735 HF rig used
to have, and it's size is smaller than Kenwood TS50 or Alinco DX70.
The faceplate is detachable and it features a simple spectrum scope,
built-in electronic keyer, 101 memories of which up to 9 alphanumeric
characters can be programmed into each memory channel.

Very slick radio, indeed....now we'll see if it's reliable and if
they can come out with it at the $1300 estimated price level.

From: gianotti@aol.com
Message-ID: <3tfid5$8nb@newsbf02.news.aol.com>
Source record: 215696

Well, I had the TH-79A(D) for a few minutes. The unit failed about 5 minutes after I took it out of the box. Sent back to AES, the PL board had gone bad. They replaced for no charge, and sent back promptly. After a few weeks I was very unhappy with the radio (could not use it in my shack when the computer was on - too much noise).

Ended up with the Yaesu FT-51R. Great radio and the computer software for programing is fantastic. Recommend the Yaesu.

5905. police radio manufacturers?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-05 00:00:00 UTC
From: jose@riter.computize.com
Message-ID: <jose.157.0015F7CA@riter.computize.com>
Source record: 215699

this being a rec.* newsgroup, my question is probably inappropriate. However, I can't find very many groups related to this so please bear with me.

We are looking for manufacturers of police radios and motorcycle attachments for police radios.

Unfortunately, Kenwood, E.F. Johnson, and several others we have tried no longer manufacture police radios leaving us with either Motorola or Ericsson/G.E as our only choices.

These two cannot be the only suppliers of this equipment in the United States, let alone the world, so if anyone knows of any other manufacturers, I would appreciate your letting me know.

Since I will be out of town for a week, and my provider's news server isn't of a huge capacity, I would greatly appreciate e-mail followups in addition to a post.

Thank you!

I agree with Tom, beforew I would plug screw holes with
'Radiator Stop Leak", you might want to check the keyboard (and cable)
and the monitor and modem. The RF is probably comming from non-shielded
cables. There are chokes available for keyboards, etc.

Ethernet thick coax is 50 ohms, like RG8U. You may be thinking of
CATV hardline, that is 75 ohms.

When I got my TNC I was told by every dealer I talked to that the PK232
had a better front end and would work better on HF. Since I'm intrested
in getting back into HF I thoguth this was a good advantage.

I'm still saving for that HF rig so I don't have expirence. Anyone have
any expirence with this? Or did I end up with the PK232 for no good
reason?

Thanks!

From article <3tepbh$4b1@ixnews6.ix.netcom.com>, by gsparks@ix.netcom.com (Glenn Sparks):
> rec.radio.swap is used for the buying and selling of equipment.
>
> However I do not object to the items appearing here. I do object to
> crossposting so many things so I see it on all of the newsgroups.

Count me as one who DOES object. People went through a LOT of work
and discussion about a year ago coming up with a restructuring of
the rec.radio.amateur hierarchy, complete with defining the charters
of the proposed newsgroups. The proposal was put to a vote and the
current hierarchy is what passed.

I don't think people are deliberately posting to the wrong newsgroup.
They just don't know any better. They see other people posting FS and
WTB articles to rec.radio.amateur.equipment so they, naturally, think
that it's okay. Then, others see it and repeat the process. It keeps
feeding on itself.

It appears that we simply need to educate newcomers to USENET on
a regular basis. Maybe the Guide to the Personal Radio Newsgroups
needs to be posted more than once a month? This assumes, of course,
that people are going to actually read it. 8^{)

The other thing is to send e-mail trying (tactfully) to explain that
rec.radio.swap is the appropriate newsgroup for buying, selling,
and trading radio equipment and that this newsgroup is for the
discussion of production amateur radio equipment. Thankfully, most
people seem to take such e-mail in the spirit it was intended.

73,

5911. Re: IC-735 vs FT-840 for expedition?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-06 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <3tfc0u$t1o@tilde.csc.ti.com>
Source record: 215604

Greetings Richard,
I would vote for the IC-735. Though a little older than the FT-840, it has a very solid track record (the kind you want and need when boating or living in foreign lands where radio repairmen seldom exist).

Many of the DX contacts that I make from Taiwan are from Maritime hams. Though various rigs are in-use, their #1 priority is reliability. I've used the Yaesu-FT890 for about 4 years (as it includes a built in antenna tuner), but would vote for the IC-735 if I had to choose between it and the FT-840.

Just my 2 cents worth

It is 50 ohms and works fine for feed line. It will perform with real
low loss. However the foam dielectric will break down quickly if
exposed to high voltages - it's designed for low voltage data.
I wouldn't use it between an antenna and a tuner.

AMphenol seems to deal heavily through distributors. Some numbers you
could try are:

Pytronic Pittsburgh 800-562-5388
ISI 800-752-4777
Simcona 800-274-6266
Connector Rancho Dom. 800-421-5840
Distribution
Corp.

These numbers came from the Electronic Source Book, Mid Atlantic Ed. 1991
so they could be out of date. The distributors should be able to send
you free literature if they think you are a serious buyer.

good luck,

Doug Ripka KA3TTQ

5915. ICOM 471H: Need Service Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-06 00:00:00 UTC
From: dew@gray.cb.att.com
Message-ID: <DB9vK9.D3D@nntpa.cb.att.com>
Source record: 215608
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I am trying to troubleshoot a problem with my ICOM
IC-471H and I am in need of someone with a service
manual for this radio. I have the schematic and think
I have isolated the problem down to the PLL board
and in particular the xtal oscillator, 9X multiplier
and amplifier chain of Q1 through Q4. I need to know
if the service manual provides any information about the
signal levels I should see along this chain. Also any
adjustment procedure provided for these stages would be
helpful.

The symptoms I am having is that there is significant
drop off in xmit output power (it is variable, but
sometimes as much as from 70 down to 10 watts) when
tuning through 440.000 to 439.999. I know that the xtals
for the oscillator switch at this frequency and I do see a
minor change in the signal waveform at the output (test
point J4) of the chain when the oscillator switches. I am
suspecting that the gain through the multiplier chain is too
low and this is causing the output to the PLL (IC3)mixer to
be very marginal. It also may be that the xtal for the lower
10MHz is weak. The reason I am suspecting it is more than just
a weak xtal is the the power output even on the upper
10MHz is highly variable both over frequency and over
time.

I would appreciate any help from someone with a service
manual for this radio.

Thanks,
Dave Woolf - K8RSP

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I am strongly considering purchasing this little radio within a month or so, and wanted net reviews before the purchase.

To the best of my knowledge, Standard has been (one of) the best companies to offer "DC to daylight" receive, amazing noise filtering to reject interference, and incredibly rugged construction.

I know the transmit coverage with the stock antenna and tiny output power is only good for local coverage.

How is receive around the broadcast FM band (100 - 108 Mhz)?

Also, how about receive around 200 - 350 Mhz?

Thanks much for any and all reviews.

I looked at Icom 706 on Japanese CQ magazine. Price is about 120000 Yen.
Currently rate to 1 US$=84Yen. So it is about $1400. However usually
Icom US makes different price tag than we get in Japan.

|> >>I read their brochures and it almost have indentical features.
|> >>
```

I can't say for sure which is better, but I own both, and I like the
Kenwood better. It is much more intuitive to use and has a feature
that the 5200 does not: the ability to listen to two 2 meter freqs
at the same time. The 5200 runs 5 or 50 watts. 733 has a 25 watt
setting. Band switching is better on 733. Seperate volume controls
on 733 beats 5200s single volume and balance control. etc.

Intermod? Yes, yes I have heard that the Kenwood is worse, but I can't
tell any differance in the two. They both have intermod rejection
problems in the same parts of town. If I were to do it over, I would
get 733s for both vehicles. Anybody wanna buy a 5200?

From: dpbaker@lilly.com
Message-ID: <1995Jul6.071828.5395@inet.d48.lilly.com>
Source record: 215612

The crossband repeat function is not documented in the manual. I don't believe that you can "store" a cross band repeat setup as you are describing. You select the freqencies you are using and then enable it with the procedure below. If you select full cross band repeat, you
will not be able to shut it off while the radio is actually cross band repeating (receiving and
retransmitting a signal). If there is activity, it won't allow you to turn the crossband repeat off,
you will have to power down the radio.

```
------------------------------
Cross Band Repeating
------------------------------

Cross band repeat isn't documented but comes ready from the factory.
To enable cross band repeat from the front panel, first select a band
by pressing BAND SELECT. Then, change the control to the other band by
hitting [CONT SEL]. Next, press [F] for one second, then the "X" button
(far right side). Decimals will appear between the Kilohertz digits, and
the "ON" indicator will light momentarily. The microphone sequence to
enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by
turning on the radio with [LOW] pressed. They also recommend enabling
the Time-out Timer, for obvious reasons.

Note that the TM-733 can also be used as a "one-way" cross-band repeater.
For example, if you can receive a distant repeater with your HT, but have
difficulty getting into it, you can use the TM-733 to boost your transmitted
signal. To set this up, just omit the part where you "change the control
to the other band by pressing [CONT SEL]." Doing this will setup the TM-733
to repeat your signal to the other band, but will not retransmit the distant
station back to you. If this sounds ambiguous, play around with it a little
and it will begin to make sense.

The best way to deter the continued missuse of the new group is to
not respond to any of the WTB: or FS: type posts.
So when that add shows up FS:Please help me get rid of this, IC-781, $50.00
Make Sure YOU don't respond, but rather quietly send them an e-mail to
let them know that it's not appropriate. I'll be quitely dialing their
phone number.
Point is, you have a problem with the fact that everyone here are excited about
radios, they want to talk, exchange information, but the bottom line is, what
does it really hurt having a few missguided soles post this stuff.
Once they get farmiliar with the net, they will find rec.radio.swap is more
effective, and goe there. I really don't think there is much that can
be done outside of moderating, and who wants to do that?

Regards, Brad Mitchell

>
>Thanks for any comments!!
>Drew
>loker@tenet.edu

Drew,
Obviously, you don't want to buy your rig from Universal Radio,
since the dumbass that told you an HT is only good for 2-3 miles works
there. You should easily be able to get 15-20 miles into a repeater,
depending on the quality of the repeater's receiver.
If you want an 2 meter HT that also receives 440, then you've got
the Standard C178A, Icom T21, and the Alinco DJ-G1T to chose from. I'm a
big fan of Standards, but they're expensive, so you might want to look into
one of the other rigs. Personally, I forget the whole idea of buying a 2
meter HT and just go ahead and buy a dualbander, since you'll probably end
up wanting to get one in a couple of months anyway. As I said earlier, I'm
a proponent of Standard, but the Icom W31AT seems to be a nice enough HT
and is fairly inexpensive, at around $420.00. you can also pick up a Yaesu
FT530 or an Alinco DJ580/582 for around $400.00. With a dual band Ht you'd
only be spending an extra 70 or 80 bucks and you'd find the enhanced
capabilities well worth it.
If you've got anymore questions, drop me a note, I'd be happy to help.

5922. ICOM725 disassembly

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-06 00:00:00 UTC
From: jma@ih4gp508.ih.att.com
Message-ID: <DBAp4z.7Ky@ssbunews.ih.att.com>
Source record: 215615

I have an ICOM 725 that needs a little contact cleaner on the noisy squelch and RF output level controls. The "disassembly instructions" in the owners' manual don't say anything about how to remove the PC board from behind the front panel to get access to these controls. It isn't apparent how to remove the knobs from the AF level and MIC level controls which would seem to be a necessary first step. These knobs don't seem to be slip on types and there are no visible setscrews. I'd like to avoid the "Armstrong method" of disassembly if I can. 8-)

Can anyone provide info from a service manual, or some experience with this radio?

Caveat emptor: while it may have reasonable loss at HF frequencies, the
cable quickly becomes VERY lossy at VHF and higher. I used to use
(note past tense) this stuff in five foot lengths for interconnections
on my 440 MHz repeater. After seeing some unusually high loss numbers,
like losing 5W at 90W in on one end, I did some testing at 440 MHz and
was shocked enough to promptly replace all of the Ethernet coax
in my repeater.

Very seductive, especially after you've cross-sectioned the stuff--
double wire/foil shield, and a silver-plated center conductor.

Out here in the land of 9000' antenna towers, it's possible to make solid contacts into a mountain top repeater from hundreds of miles away using a five watt HT. I've done this from an 11000' peak north of Flagstaff, AZ down to our 440 repeater at 9000' north of Tucson. Used an Icom IC32AT w/ 5w battery pack and a 3 element yagi taped to my hiking stick. Range is affected by everything. Hieght above mean elevation by both stations, power, antennas, the color of your socks, and several other things. I've had a hell of a time communicating with someone 200yds away at a particular location along a mountain highway. If not for the helicopter noise, we'd of just stuck to LOW LOW Band (300hz to 3000hz).

Source record: 215621

Many thanks, again, to those with ideas. They were all helpful.

I finally got it working carrier squelch. The trick was to remove the PL INDICATOR line (green-brn) from the receiver audio board, short the PL DISABLE line to ground, and move the two jumpers on the SQUELCH GATE card from PL to Carrier Squelch positions. We had previously thought that just moving the two jumpers should work.

These instructions were burried in a paragraph about servicing a PL repeater.

Hope this helps if any of you out there want to use an existing Motorola controller.

This open repeater is located on the Johnson/Miami county, Kansas, line about one mile west of the Missouri state line. The base of the repeater antenna is 30ft AGL as it is a very high location. Frequency is 444.075 out /449.075 in, QRZ. It is now 12 watt output. Future plans include increasing output power and raising antenna height. Repeater is owned by the Shawnee Mission Medical Center Radio Club. Repeater call is WB0JQM/R.

John Marcus (marcusj@interaccess.com) wrote:

: Oh, by the way, I am against RADIO SHACK because they don't make it a habbit
: to screen out non-hams when selling ham gear.

Why blame RS? It's not their place to police the ham bands. Besides, it's
not illegal to buy any radio equipment that is capable of transmitting; it's
only illegal to transmit without the proper authorization. At that point,
it's a regulatory problem over which FCC has primary jurisdiction. Whether
they choose to act or not, it is still an FCC problem, and not RS.

Tell you what...go into HRO, AES or any other store that caters to hams, and
attempt to buy a HT. My bet is that they will sell it to you anyway.
Better yet, try mail order.

From: rab6@ukc.ac.uk
Message-ID: <936@kiwi.ukc.ac.uk>
Source record: 215626

Hello - this is my first posting,
Following on the thread about the ICOM IC-735,this seems to be a
reliable rig for a club and for use on expeditions. Also it seems to
be highly recommended for use on offshore yachts. I would like to ask
for any opinions on the use of the Yaesu FT-840 in similar situations.
This rig seems to be much more modern and I would like to know
if there are any advantages or disadvantages over the ICOM that
I have missed.The secondhand prices seem to be comparable in the UK so
I see no way of distinguishing between the two. I know that the Kenwood
TS-50 has also been recommended but this seems to fall into a higher price
bracket which our club cannot afford.
I am primarily interested in its suitability for use on a sailing
expedition and as a base station for university club use. A Trio TS-130
had also been recommended as a suitable cheaper alternative.

I would be grateful for any info/opinions on this and advice from
anyone who has experience in maintaining communications with a boat
travelling from the Mediterranean via the Red Sea and across the Indian Ocean.
I have heard that Maritime Nets exist but only have info about the States
and Pacific not the Indian Ocean. Many thanks for any help that you can
offer.

I gave up on Fords years ago because of RFI. Try as I might,
I never could get all that damn ignition noise out of the HF rig.
Several other hams I know had the same problem. Pick another make
of car!

I'm sorry to hear of your misfortune with AEA.. I myself have had very good luck with them. I own a 2M hotrod telescoping antenna for my HT. I had the antenna on the HT and got the tip of it caught on the door of a van. It broke part of the impedance matching section inside. We thought at first that it simply broke a part on the telescoping piece so we took it apart and attempted to fix it only to find that it couldn't be done. I called AEA and they were glad to have me send it in and fix/replace it even with it torn apart. It took about three weeks and I got a brand new 2M hotrod antenna in the mail no questions asked. I've had real good look with their service and there antennas.

5936. Kenwood 440 filter question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-06 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <2947.805011421@safety.ics.uci.edu>
Source record: 215629

Anyone know how the 440 handles its 455 kHz IF? I have the CFJ455k14
MuRata ceramic filter (stock) in there, but tried swapping the
Kenwood crystal filter, YG455S-1, that came from the 950. The
signals go about 40 db down, and I can hear the other sideband. Youch!
Not a good thing. Anyone know what is happening to me?

I understand from "dr." Rich Measures that the Kenwood 940 ceramic stock
filter, the MuRata CFJ455k12 or the CFJ455V12 will drop right into
the 440, no problems. The 940 also uses the YG455 series filters in
the CW line. That made me think that the YG455S-1 should also mate
with the 440. Not so....

Anyone have any hints on this one?

Source record: 215630

On the 15 meter SEASON net, I worked a JA using the new IC-706. We QSY'd and had a 30 minute QSO about the new rig. He picked it up about 2 weeks ago in Akihabara, Tokyo and paid 140,000 yen (US$1650.00). Since I was using the Alinco DX-70, we ran several comparisons back and forth about features etc. The 100 watt PA on 6 is GREAT (compared to only 10 w from the Alinco) but the 10 watts on 2m is not enough umpf for good 2 meter work in Japan (no rpts on 2m in JA). So, Masa plans to add an amp for 2 mtrs and mount in his Toyota Skyline. No filters with the ICOM (extra/optional), and Masa complained of having "a little too much in a small box", meaning the software is complex. BTW, the Alinco in Japan is just under 100,000 yen (US 1175) so the price of the ICOM is not as attractive as I would have thought. 73

Maybe the case in Michigan, but not so out here in the west where a
typical repeater may be on a mountain at an elevation of 3000-10000 feet.

I can reliably hit several repeaters 45 miles from my office with my 5
watt HT with the rubber dummy load antenna. Do it all the time.

I operated from SP with no-tone HT and it was easy. I usually managed
to whistle the right tone in 1-3 tries. The tone is needed only
to activate the repeater for the first time. Then one can talk
without using the tone until the repeater times out, which usually
does not happen until the end of QSO.

I don't know if this is the correct newsgroup to ask this, but
I'm looking for a radio which can receive (not transmit) these
bands:

cb, pb, wb, ab, tv, fm, am

Does such a thing exist? Ideally, it would be in a "component" form so I
could use it instead of my am/fm receiver, but that's not necessary.

Thanks for any leads.

My two cents worth. I have been fighting the problem with a packett station. Watch out for the TNC. I have a PCB 88 which generates RF on 144.55 (a really great frequency plus stuff in the 222 MHz and 440 MHz areas. A well shielded cable is required and extra grounding for the host computer is also necessary. I seams to help getting a good ground connection between radio and TNC and computer. Since the RF noise is on the radio connection (TNC to radio) I bet the PK-88 has the same problem. The monitor is a frequent culprit. The Radio Shack snap over ferrite helps.

Good Luck,
Bill Harwood

You should spring for a dual band handy. Nearly all of the new ones do the scanner task well. 440MHz is fun and Handys work better at 440MHz. The second band in a handy is one of the best bargins in America. For less than $150 you get the scond radio the same (almost small package) you don't need extra batteries/chargers ... and you don't have to carry two little boxes around. What a deal!!!!!

From: n4lq@iglou.iglou.com
Message-ID: <DB9y0E.EHv@iglou.com>
Source record: 215648

All the artices about Bazooka antennas recommend RG 58 or 50 ohm cable
Is there any reason that RG62, 93 ohm cable can't be used? I realize
the velocity factor is different so there would be a slight lenght
adjustment to make. But does the impedance matter?

Also, has anyone tried putting these antennas in parallel i.e. 160 and
80 meters?

Any tips on making a strong connection between the coax and the end wire?

5958. Help needed: Azden PCS-300 Power Reqmt???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: dcurtis@iquest.net
Message-ID: <DBBnGz.85C@iquest.net>
Source record: 215551

I offered to help an older ham get his Azden PCS-300 HT back on the air. The battery pack was shot so I bought a new one and put it in the radio (9.6 volts, 8 cells). The radio is charged via a coaxial power connector on the bottom. Without any instructions available, I attached a 12v DC, center positive, charger cable. This is a charger I've used with other HTs and scanners. The radio quickly developed a bad smell, a little smoke, and there's no display!!!! Can anyone tell me what the power supply (connector) for the PCS-300 is supposed to look like? (AC/DC, 12v, positive/negitive center, etc.) Did I do something bad or was the radio shot when I got it? Thanks for any information!

>How do you feel about one versus the other, now that you've traded?

I use the R-7100 the same ways I used the R-7000: for monitoring,
chasing down interference sources and bootleggers, and as test
instruments. I don't use either much for *scanning* per se because both
contain relays and are relatively slow.

Both are great VHF/UHF receivers but not great scanners (the PRO-2006
and BC9000XLT are great scanners).

I wrote this a few years ago:

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the
older R7000, but the R7100 is constructed using surface
mount parts. Consequently, the R7100 is smaller. A-B tests
indicate both the R7100 and Radio Shack PRO-2006 receivers
are about equally sensitive, and more sensitive than the 6
year old R7000. Both the R7000 and R7100 are much more
immune to intermod than the Uniden/Bearcat 760XLT and the
portable PRO-43.

Many of the functions controlled by separate rotary switches
and potentiometers in the R7000 are controlled by pushbutton
switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was
replaced with 3 indicators on the R7100, a left arrow, a
square, and a right arrow. In my R7100, the square lights
if you are tuned within 2.5 kHz of center of an FM station,
a larger window for WBFM signals. The arrow indicates the
direction in which the tuning knob should turned to center

the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a front panel switch. The AFC will automagically tune the receiver close to the center frequency if you tune near an FM signal. You can watch the frequency change as the AFC steps the receiver in 100 Hz increments (on NBFM). The AFC never quite tunes to the exact center, but tunes within a window set by a difference amplifier circuit, so the station sounds good even though the R7100 is slightly off center frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger draw-

back is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a similar price range, I prefer the newer R7100. Sensitivity aside, both are about equal communications receivers, but the R7100 is a better scanner, especially for finding new frequencies and organizing memory.

>I never could get all that damn ignition noise out of the HF rig.
>Several other hams I know had the same problem. Pick another make
>of car!
>

I have a 94 Mazda 4x4 Extra-Cab (a Ford Ranger with a Mazda Tailgate). The
truck is manufactured on the Ford assembly line so it's really a Ranger.
I've installed a dual band IC2700H in the truck and have had no problems
at all. Before buying the truck I inquired about RFI/EMI problems. This is
what they had to say about electromagnetic compatibility:

1) Don't run coax over or near main computer which is located behind the
middle of dashboard.
2) Tune and install the antenna for low SWR. A lot of RFI/EMI problems
are a result of RF running all over the truck. (Common sense)
3) Try to keep the output power <20 watts. I run 50 watts on VHF and have
no problem.

As far as ignition noise, I wired my radio directly to the battery. They
provide a nice plug in the firewall near the emergency brake so its real
easy to do. I experience absolutely no RFI or EMI problems with the radio
or the electronics in the truck. I don't use decoupling caps or power
filters either. Even with the defroster on, not a trace of noise!
I paid close attention to the installation procedure
(ie grounding, etc) and had great success.

Good Luck,
Peter

PS
It's an awesome truck. I've owned a Toyota 4X4 that was a wonderful truck but
I'll take the Mazda/Ford over it anyday.

5962. Heavy Duty Antenna Tower For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC

This message is being posted for a friend. Please use the contact info
included in the message.

Heavy Duty Antenna Tower For Sale

Create a mini antenna farm with one tower, lots of space to prevent
interference. Three (3) sided twelve feet (12) between legs, forty feet
high (40). Twenty (20) foot verticle sections with lots of cross members
for super strength and ease of assembly. Never assembled!

This would be a perfect tower for a small city police/fire dept.
Can be mounted on the ground or building top. Also suited for mountain
top where sever wind, ice, snow loads could occur. Suited for mounting
10 foot parabolic dish antenna.

New price was about $8000.00. Asking price is #3500.00.

I am looking to buy a dual band (2m/70cm) radio in the next 2 months. I
am looking for the following features:

Must have:
1. Built in CTCSS encoder
2. 35 watts on 70cm and 50 watts on 2m
3. Mike with DTMF pad
4. Several memory channels - at least 50
5. Band and memory channel scan
6. LCD display (not LED)
7. Several auto dial memories (more than 5)

Nice to have:
1. In band and cross band receive
2. Built in CTCSS decoder
3. Ability to mount radio and face plate separately
4. Cross band repeater
5. Quick release detachable face plate

5967. Can 2M portables do this?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: award@auspex.com
Message-ID: <3tk9gh$p18@alpha1.auspex.com>
Source record: 215560
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I need a couple portables (hand-helds) that can operate in the 151-154 Mhz region. This is a commercial band. The problem is that commercial radios seem to be $400-600 MORE than 2M units and they operate about the same frequency. I understand that many of the handhelds (Yaesu, ICOM, Kenwood, etc) can RECEIVE out of the 2M band, but not transmit. Can some of these be modified to TRANSMIT (with license, of course) in the 154 Mhz region?

What would you advise?

-Andrew

Missionary friends in Amazon valley (500 miles from nearest road!) have sent their Yaesu 757GX to me so I can get someone to repair an intermittent problem. I'm not sure who to send it to for best results. Please give me your recommendations.

Hey John, Does your planet have mail order stores?

Here on Earth, virtually nobody will ask to "screen" a customer.

I guess you'd be against everyone and end up homebrewing a lot of gear?

AOR makes a line of scanners that covers these bands. They have
two handheld's and one table top scanner. You can call their
distributor in the U.S. at 703 938 8105 (Electronic Distributors)
or call our sales desk at 800 368 3270 and ask to have some
literature sent to you. If you have a fax you can have the info
faxed to you but call the technical desk at 703 938 3350.
Hope this helps.

Henry 2K Console. This is the floor standing amp with the massive power supply. Two 3-500Z tubes pump out full power with ease. Nearly instant on, ready to transmit without warm up. Great buy if you will pick it up in Southern California -- $600.00. Excellent shape, by the way. Must have 220 V, be aware. Please e-mail to RichRam@rain.org.

There are numerous recievers that cover all these frequencies and modulations. The ones that I know of need an outboard adapter for video, but cover everything else in one box. Contact Electronic Equipment Bank (EEB) at 800-368-3270; they'll be happy to fix you right up.

5975. Handheald radios in different bands (2 M)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: awardblvr@aol.com
Message-ID: <3tjvbd$qv9@newsbf02.news.aol.com>
Source record: 215568

I am needing a commercial radio for my business. I have radios in the 151 Mhz
and 154 Mhz bands. I guess this is pretty near 2 M.

My question is this. Can some of the amatuer radios like kenwoods, ICOMS, Yaesus, etc be programmed to operate in these bands? These amatuer radios seem to be significantly less expensive and have more features.

Please advise.

Aside from the obvious (i.e. the battery packs that Radio Shack makes for it), the older Icom series packs will also fit. These are the low-numbered ones (BP-2,3, up to BP-8, I think). This series of packs will look pretty much the same as the ones that come with the radio.

You can commonly find them at hamfests (though you can never be sure of the condition of the cells).

Ham HTs can usually be modified to do this but they
are not approved for use in the Land Mobile Service.
Although unlikely, you could become an object of the
FCC's attention. Reasonable deals can often be found
on used radios from PDs that have upgraded or traders
at hamfests. Often a local ham will have a source.
Crystal or program it for the your frequency and it
doesn't end up being that big of an investment.

By getting a used commercial radio you end up with a
more rugged radio designed for service you intend.
Ask any cop how rugged a Motorola can be.

The suggestion to whistle is valid. I found that slowly changing the pitch was usually enough to get the right tone the first time.

Enjoy your trip,

73, Paul
